1. GENERAL DESCRIPTION

A compact size, light weight, simple mounting on the DIN-rail and the quick connect spring-clamp terminals are what makes the MiniLine power supplies so easy to use and installs in seconds.

A rugged electrical and mechanical design as well as a high immunity against electrical disturbances on the mains provides reliable output power. This offers superior protection for equipment which is connected to the public mains network or is exposed to a critical industrial environment.

The MiniLine series offers output voltages from 5 to 56Vdc and a power rating of up to 100W. A DC-OK signal allows remote diagnostics.

The supplementary MiniLine decoupling diode module MLY02.100 allows building of redundant systems or to protect against back-feed voltages.

2. SHORT-FORM DATA

Output voltage DC 24V
Adjustment range 24-28V
Output current 2.1–1.8A 24-28V
Output power 50W
Output ripple < 50mVpp 20Hz to 20MHz
Input voltage AC 100-240V Wide Range Input
Mains frequency 50-60Hz ±6%
AC Input current typ. 0.77 / 0.44A at 120 / 230Vac
Power factor typ. 0.56 / 0.52 at 120 / 230Vac
AC Inrush current 17 / 35A typ. peak value at 120 / 230Vac
40°C and cold start

DC Input 85-375Vdc
Efficiency typ. 88.4 / 89.0% at 120 / 230Vac
Losses typ. 6.6 / 6.2W at 120 / 230Vac
Temperature range -10°C to +70°C operational
Derating 1.3W/°C +60 to +70°C
Hold-up time typ. 35 / 190ms at 120 / 230Vac
Dimensions 45x75x91mm WxHxD

ML50.100, ML50.109
24V, 2.1A, SINGLE PHASE INPUT

Mar. 2007 / Rev. 1.0 DS-ML50.100-EN
All parameters are specified at 24V, 2.1A, 230Vac, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
INTENDED USE

The power supply shall only be installed and put into operation by qualified personnel.

This power supply is designed for installation in an enclosure and is intended for the general use, such as in industrial control, office, communication, and instrumentation equipment. Do not use this device in aircraft, trains and nuclear equipment, where malfunctioning of the power supply may cause severe personal injury or threaten human life.

TERMINOLOGY AND ABBREVIATIONS

PE and ♂ symbol

PE is the abbreviation for Protective Earth and has the same meaning as the symbol ♂.

Earth, Ground

This document uses the term “earth” which is the same as the U.S. term “ground”.

T.b.d.

To be defined, value or description will follow later.

AC 230V

A figure displayed with the AC or DC before the value represents a nominal voltage with standard tolerances (usually ±15%) included.

E.g.: DC 12V describes a 12V battery regardless whether it is charged (13.7V) or discharged (10V). As long as not otherwise stated, AC 100V and AC 230V parameters are valid at 50Hz and AC 120V parameters are valid at 60Hz mains frequency.

230Vac

A figure with the unit (Vac) at the end is a momentary figure without any additional tolerances included.

DISCLAIMER

The information presented in this document is believed to be accurate and reliable and may change without notice.

The housing is patent by PULS (US patent No US D442,923S)

No part of this document may be reproduced or utilized in any form without permission in writing from the publisher.

</tbody>
</table>

**Instructions for DC use:**

a) Use a battery or similar DC source.
b) Connect +pole to L and – pole to N.
c) Connect the PE terminal to a earth wire or to the machine ground.
d) In case the – pole of the battery is not connected to earth, use an appropriate fuse to protect the N terminal.
8. **Hold-up Time**

<table>
<thead>
<tr>
<th></th>
<th>AC 100V</th>
<th>AC 120V</th>
<th>AC 230V</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hold-up Time</td>
<td>typ.</td>
<td>54ms</td>
<td>82ms</td>
</tr>
<tr>
<td></td>
<td>typ.</td>
<td>26ms</td>
<td>40ms</td>
</tr>
</tbody>
</table>

Note: At no load, the hold-up time can be up to several seconds. The green DC-ok lamp is also on during this time.

9. **DC-OK Output**

This feature monitors the output voltage, which is present on the output terminals. The signal is a source output which can feed loads up to 30mA. Loads can be a 24V relay (Rcoil < 700Ohm), a LED or the input of a PLC system. The relays operates or the LED is on if output voltage exceeds the threshold level. A free-wheeling diode (necessary when the load is a relay) is already included in the power supply.

<table>
<thead>
<tr>
<th>Threshold value</th>
<th>20V +/-4%</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output current</td>
<td>min. 30mA</td>
</tr>
<tr>
<td>Output voltage</td>
<td>min Vout – 1V at 30mA</td>
</tr>
</tbody>
</table>

For typical values see Fig. 9-2

The open collector is internally linked to the positive output pole. The DC-OK voltage is approximately the output voltage if the output voltage is higher than the threshold level.

---

Mar. 2007 / Rev. 1.0 DS-ML50.100-EN
All parameters are specified at 24V, 2.1A, 230Vac, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.

</tbody>
</table>

**Fig. 10-1** Output voltage vs. output current, 230Vac, typ.

**Peak current capability (up to several ms)**

The power supply can deliver a peak current which is higher than the specified short term current. This helps to start current demanding loads or to safely operate subsequent circuit breakers.

The extra current is supplied by the output capacitors inside the power supply. During this event, the capacitors will be discharged and cause a voltage dip on the output. Detailed curves can be found in chapter 27.1.

Peak current voltage dips
- typ. from 24V to 16V at 4.2A for 50ms, resistive load
- typ. from 24V to 15V at 10.5A for 2ms, resistive load
- typ. from 24V to 10.5V at 10.5A for 5ms, resistive load

MTBF SN 29500, IEC 61709
2 383 000h
3 977 000h

MTBF MIL HDBK 217F
1 021 000h
1 370 000h

The **Lifetime expectancy** shown in the table indicates the operating hours (service life) and is determined by the lifetime expectancy of the built-in electrolytic capacitors.

Lifetime expectancy is specified in operational hours. Lifetime expectancy is calculated according to the capacitor's manufacturer specification. The prediction model allows a calculation of up to 15 years from date of shipment.

**MTBF** stands for **Mean Time Between Failure**, which is calculated according to statistical device failures, and indicates reliability of a device. It is the statistical representation of the likelihood of a unit to fail and does not necessarily represent the life of a product.
14. FRONT SIDE AND USER ELEMENTS

DC-OK LED (green)
On when the voltage at the output terminals is > 20 V
DC-OK LED and DC-OK signal functions are synchronized

Output Voltage Potentiometer
Turn to set the output voltage. Factory set: 24.5V

Input Terminals
Spring-clamp terminals
N ... Neutral input
L ... Line (hot) input
... PE (Protective Earth) input

Output & Signal Terminals
Spring-clamp terminals
Dual terminals per pole
+ ... Positive output
- ... Negative (return) output
Dual pins per pole
DC-OK ... Open collector output
Indicates an output voltage higher than 20Vdc

15. TERMINALS AND WIRING

All terminals are easy to access when mounted on the panel. Input and output terminals are separated from each other (input below, output above) to help in error-free wiring. Mounting and wiring do not require any screwdriver.

Type | Quick-connect spring-clamp terminals
--- | ---
Solid wire | 0.3-4mm²
Stranded wire | 0.3-2.5mm²
American wire gauge | 26-12 AWG
Ferrules | Allowed, but not required
Wire stripping length | 6mm / 0.25inch
Pull-out force | 12AWG: 60N, 14AWG: 50N, 16AWG: 40N (according to UL486E)

Instructions:
- Use appropriate copper cables
- Follow local and national installation codes and regulations!
- Ensure that all strands of a stranded wire enter the terminal connection!
- Do not use the unit without PE connection.

Fig. 15-1 Connecting a wire
1. Insert the wire and close the lever
2. To disconnect wire: reverse the procedure
16. EMC

The CE mark indicates conformance with EMC guideline 89/336/EEC, 93/68/EEC and the low-voltage directive (LVD) 73/23/EWG. A detailed EMC Report is available on request.

</tbody>
</table>

**Criterions:**
- **A:** Power supply shows normal operation behavior within the defined limits.
- **C:** Temporary loss of function is possible. Power supply might shut-down and restarts by itself. No damages or hazards to the power supply will occur.

**EMC Emission**

- Conducted emission: EN 55011, EN 55022, FCC Part 15, CISPR 11, CISPR 22
- Radiated emission: EN 55011, EN 55022
- Harmonic input current: EN 61000-3-2
- Voltage fluctuations, flicker: EN 61000-3-3

This device complies with FCC Part 15 rules. Operation is subjected to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

**Type tests and factory tests:**
Conducted by the manufacturer. Do not repeat test in field!

**Rules for field test:**
Use appropriate test equipment which applies the voltage with a slow ramp! Connect L and N together as well as all output poles.

The output voltage is floating and has no ohmic connection to ground.

To fulfill the PELV requirements according to EN60204-1 § 6.4.1, it is recommended that either the + pole, the – pole or any other part of the output circuit should be connected to the protective earth system. This helps to avoid situations in which a load starts unexpectedly or can not be switched off when an unnoticed earth faults occur.

23. USED SUBSTANCES

Electrolytic capacitors included in this unit do not use electrolytes such as Quaternary Ammonium Salt Systems.

Plastic housings and other molded plastic materials are free of halogens, wires and cables are not PVC insulated.

The unit conforms to the RoHS directive 2002/96/EC

The materials used in our production process do not include the following toxic chemicals:

- Polychlorinated Biphenyl (PCB), Pentachlorophenol (PCP), Polychlorinated naphthalene (PCN), Polychlorobiphenyl (PBB), Polychlorinated Biphenyl Oxide (PBO), Polychlorinated Diphenyl Ether (PBDE), Polychlorinated Diphenyl Ether (PCDE), Polychlorobiphenyl Oxide (P8DO), Cadmium, Asbestos, Mercury, Silica

Mar. 2007 / Rev. 1.0 DS-ML50.100-EN

All parameters are specified at 24V, 2.1A, 230Vac, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
24. PHYSICAL DIMENSIONS AND WEIGHT

<table>
<thead>
<tr>

<th>240g / 0.53lb</th>
</tr>
</thead>
<tbody>
<tr>
<td>DIN-Rail</td>
<td>Use 35mm DIN-rails according to EN 60715 or EN 50022 with a height of 7.5 or 15mm. The DIN-rail height must be added to the depth (91mm) to calculate the total required installation depth.</td>
</tr>
</tbody>
</table>

Electronic files with mechanical data can be downloaded at www.pulspower.com

![Diagram of physical dimensions](image)

25. INSTALLATION AND OPERATION INSTRUCTIONS

**Mounting:**
Output terminal must be located on top and input terminal on the bottom. For other orientations see chapter 27.12. An appropriate electrical and fire end-product enclosure should be considered in the end use application.

**Cooling:**
Convection cooled, no forced cooling required. Do not cover ventilation grill (e.g. cable conduits) by more than 30%!

**Installation clearances:**
25mm on top and bottom.

**Risk of electrical shock, fire, personal injury or death!**
Do not use the unit without proper earth connection (Protective Earth).
Turn power off before working on the power supply. Protect against inadvertent re-powering.
Make sure the wiring is correct by following all local and national codes.
Do not open, modify or repair the unit.
Use caution to prevent any foreign objects from entering into the housing.
Do not use in wet locations or in areas where moisture or condensation can be expected.

**Service parts:**
The unit does not contain any service parts. The tripping of an internal fuse is caused by an internal fault. If damage or malfunctioning should occur during operation, immediately turn power off and send unit to the factory for inspection!
26. ACCESSORY

**DIN-Rail bracket for wall or panel mount**
A DIN-rail bracket is included in each shipping box.

**MLY02.100 Dual decoupling module 2x5A**

---

Mar. 2007 / Rev. 1.0 DS-ML50.100-EN
All parameters are specified at 24V, 2.1A, 230Vac, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
27. APPLICATION NOTES

27.1. PEAK CURRENT CAPABILITY

Solenoids, contactors and pneumatic modules often have a steady state (sealed) coil and a pick-up coil. The inrush current demand of the pick-up coil is several times higher than the steady state current and usually exceeds the nominal output current. The same situation applies, when starting a capacitive load.

Branch circuits are often protected with circuit breakers or fuses. In case of a short or an overload in the branch circuit, the protective device (fuse, circuit breaker) needs a certain amount of over-current to trip or to blow. The peak current capability ensures the safe operation of subsequent circuit breakers.

Assuming the input voltage is turned on before such an event, the built-in large sized output capacitors inside the power supply can deliver extra current. Discharging this capacitor causes a voltage dip on the output. The following two examples show typical voltage dips:

![Fig. 27-1 Peak load 4.2A for 50ms, typ.](image1)

![Fig. 27-2 Peak load 10.5A for 5ms, typ.](image2)

27.2. BACK-FEEDING LOADS

Loads such as decelerating motors and inductors can feed voltage back to the power supply. This feature is also called return voltage immunity or resistance against Back- E.M.F. (Electro Magnetic Force).

This power supply is resistant and does not show malfunctioning when a load feeds back voltage to the power supply. It does not matter, whether the power supply is on or off.

The maximum allowed feed back voltage is 35Vdc. The absorbing energy can be calculated according to the built-in large sized output capacitor which is specified in chapter 10.
27.3. SERIES OPERATION

The power supply can be put in series to increase the output voltage.

Instructions for use in series:

a) It is possible to connect as many units in series as needed, providing the sum of the output voltage does not exceed 150Vdc.

b) Voltages with a potential above 60Vdc are not SELV any more and can be dangerous. Such voltages must be installed with a protection against touching.

c) For serial operation use power supplies of the same type.

d) Earthing of the output is required when the sum of the output voltage is above 60Vdc.

Note: Avoid return voltage (e.g. from a decelerating motor or battery) which is applied to the output terminals.

27.4. PARALLEL USE TO INCREASE OUTPUT POWER

Several power supplies can be paralleled to increase the output power. The ML50.100 has no feature included which balances the load current between the power supplies. Usually the power supply with the higher adjusted output voltage draws current until it goes into current limitation. This means no harm to this power supply as long as the ambient temperature stays below 50°C. If a current sharing feature is required, choose the ML50.101 or ML50.111.

Instructions for parallel use:

a) Use only power supplies from the same series (ML-Series).

b) Adjust the output voltages of all power supplies to approximately the same value (±200mV).

c) A fuse (or diode) on the output is only required if more than three units are connected in parallel.

d) Do not load terminals with more than 13A. Follow wiring instructions according to chapter 27.6.

e) Ensure that the ambient temperature of the power supply does not exceed 50°C.

27.5. PARALLEL USE FOR REDUNDANCY

Power supplies can be paralleled for redundancy to gain a higher system reliability. Redundant systems require a certain amount of extra power to support the load in case one power supply unit fails. The simplest way is to put two MiniLine power supplies in parallel. This is called a 1+1 redundancy. In case one power supply unit fails, the other one is automatically able to support the load current without any interruption. Redundant systems for a higher power demand are usually built in a N+1 method. E.g. Five power supplies, each rated for 2.1A are paralleled to build a 8A redundant system. If one unit fails, the 8A can still be drawn.
Please note: This simple way to build a redundant system has two major disadvantages:
- The faulty power supply can not be recognized. The green LED will still be on since it is reverse-powered from the other power supply.
- It does not cover failures such as an internal short circuit in the secondary side of the power supply. In such a situation the defective unit becomes a load for the other power supplies and the output voltage can not be maintained any more.

This above conditions can be avoided by utilizing decoupling diodes which are included in the decoupling module MLY02.100.

Other recommendations for building redundant power systems:
a) Use separate input fuses for each power supply.
b) Monitor the individual power supply units. A DC-ok output is included in the ML50.100, ML50.101 and ML50.111. In all other cases, use the redundancy module YRM2.DIODE which has a monitoring circuit for each input included.
c) When possible, connect each power supply to different phases of the mains network.

27.6. DAISY CHAINING OF OUTPUTS

Daisy chaining (jumping from one power supply output to the next) is allowed as long as the maximum current through one terminal pin does not exceed 13A. If the current is higher, use a separate distribution terminal block.

27.7. CHARGING OF BATTERIES

The power supply can be used for float-charging of lead-acid or maintenance free 24V VRLA batteries.

Instructions for charging batteries:
a) Ensure that the ambient temperature of the power supply does not exceed 50°C.
b) Set the output voltage on a disconnected load, very precisely to the end-of-charge voltage according to the expected battery temperature.

<table>
<thead>
<tr>
<th>End-of-charge voltage</th>
<th>27.8V</th>
<th>27.5V</th>
<th>27.15V</th>
<th>26.8V</th>
</tr>
</thead>
<tbody>
<tr>
<td>Battery temperature</td>
<td>10°C</td>
<td>20°C</td>
<td>30°C</td>
<td>40°C</td>
</tr>
</tbody>
</table>

c) Use a 4A or 6A circuit breaker (or blocking diode) between the power supply and the battery.
d) Ensure that the output current of the power supply is below the allowed charging current of the battery.
e) Use only matched batteries when putting 12V types in series.
f) The return current to the power supply is typ. 10.7mA at 25Vdc when the power supply is switched off (except in case a blocking diode is utilized).
27.8. EXTERNAL INPUT PROTECTION

The unit is tested and approved for branch circuits up to 15A (UL) or 16A (IEC). External protection is only required if the supplying branch has an ampacity greater than this. In some countries local regulations might apply so check local codes and requirements.

If an external protective device is utilized, a minimum value is required to avoid undesired tripping of the fuse.

<table>

<td>10A</td>
<td>6A</td>
</tr>
</tbody>
</table>

27.9. INDUCTIVE AND CAPACITIVE LOADS

The unit is designed to supply any type of load, including unlimited capacitive and inductive loads.

27.10. OPERATION ON TWO PHASES

Instructions for two phase operation:

a) A phase to phase connection is allowed as long as the supplying voltage is below 240V+10%.

b) Use a fuse or a circuit breaker to protect the N input. The N input is internally not protected and is in this case connected to a hot wire.

Appropriate fuses or circuit breakers are specified in section 27.6 “External Input Protection”.

27.11. USE IN A TIGHTLY SEALED ENCLOSURE

When the power supply is installed in a tightly sealed enclosure, the temperature inside the enclosure will be higher than the outside. The inside temperature defines the ambient temperature for the power supply.

Results from such an installation:

Power supply is placed in the middle of the box, no other heat producing equipment inside the box

Enclosure: Rittal Type IP66 Box PK 9510 100, plastic, 130x130x75mm
Input: 230Vac

Load: 24V, 2.1A; load is placed outside the box
Temperature inside the box: 40.8°C (in the middle of the right side of the power supply with a distance of 1cm)
Temperature outside the box: 21.9°C
Temperature rise: 18.9K

Load: 24V, 1.7A; (=80%) load is placed outside the box
Temperature inside the box: 38.7°C (in the middle of the right side of the power supply with a distance of 1cm)
Temperature outside the box: 21.7°C
Temperature rise: 17.0K
27.12. MOUNTING ORIENTATIONS

Mounting orientations other than input terminals on the bottom and output on the top requires a reduction in continuous output power or a limitation in the maximum allowed ambient temperature. The amount of reduction influences the lifetime expectancy of the power supply. Therefore, two different derating curves for continuous operation can be found below:

**Curve A1**  Recommended output power.
**Curve A2**  Max allowed output power (results approx. in half the lifetime expectancy of A1).
