**GENERAL DESCRIPTION**

The DIMENSION CP-Series units are high-end power supplies in a medium price range without compromising quality, reliability and performance. The CP-Series is part of the DIMENSION power supply family. The most outstanding features of CP10 series are the high efficiency, advanced inrush current limitation, active PFC and the wide operational temperature range.

The CP-Series includes all the essential basic functions. The devices have a power reserve of 20% included, which may even be used continuously at temperatures up to +45°C. Additionally, the CP10 can deliver three times the nominal output current for at least 12ms which helps to trip fuses on faulty output branches.

High immunity to transients and power surges as well as low electromagnetic emission, a DC-OK relay contact and a large international approval package for a variety of applications makes this unit suitable for nearly every situation.

All values are typical at 24V, 10A, 230Vac, 50Hz, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
1. INTENDED USE

This device is designed for installation in an enclosure and is intended for the general professional use such as in industrial control, office, communication, and instrumentation equipment.

Do not use this power supply in equipment, where malfunction may cause severe personal injury or threaten human life.

2. INSTALLATION REQUIREMENTS

This device may only be installed and put into operation by qualified personnel.

This device does not contain serviceable parts. The tripping of an internal fuse is caused by an internal defect.

If damage or malfunction should occur during installation or operation, immediately turn power off and send unit to the factory for inspection.

Mount the unit on a DIN-rail so that the input terminals are located on the bottom of the unit. For other mounting orientations see de-rating requirements in this document. See chapter 24.12.

This device is designed for convection cooling and does not require an external fan. Do not obstruct airflow and do not cover ventilation grid (e.g. cable conduits) by more than 15%!

Keep the following installation clearances: 40mm on top, 20mm on the bottom, 5mm on the left and right sides are recommended when the device is loaded permanently with more than 50% of the rated power. Increase this clearance to 15mm in case the adjacent device is a heat source (e.g. another power supply).

A disconnecting means shall be provided for the output of the power supplies when used in applications according to CSA C22.2 No 107.1-01.

**WARNING**

Risk of electrical shock, fire, personal injury or death.

- Do not use the power supply without proper grounding (Protective Earth). Use the terminal on the input block for earth connection and not one of the screws on the housing.
- Turn power off before working on the device. Protect against inadvertent re-powering.
- Make sure that the wiring is correct by following all local and national codes.
- Do not modify or repair the unit.
- Do not open the unit as high voltages are present inside.
- Use caution to prevent any foreign objects from entering the housing.
- Do not use in wet locations or in areas where moisture or condensation can be expected.
- Do not touch during power-on, and immediately after power-off. Hot surfaces may cause burns.

**Notes for use in hazardous location areas:**

The power supply is suitable for use in Class I Division 2 Groups A, B, C, D locations and for use in Group II Category 3 (Zone 2) environments. See section 20 for details.

**WARNING EXPLOSION HAZARDS!**

Substitution of components may impair suitability for this environment. Do not disconnect the unit or operate the voltage adjustment unless power has been switched off or the area is known to be non-hazardous.

A suitable enclosure must be provided for the end product which has a minimum protection of IP54 and fulfils the requirements of the EN 60079-15.
3. AC-INPUT

AC input
Nom. AC 100-240V Suitable for TN-, TT- and IT mains networks

AC input range
Min. 85-264Vac Continuous operation
Min. 264-300Vac For maximal 500ms

Allowed voltage L or N to earth
Max. 300Vac Continuous according to IEC 62477-1

Input frequency
Nom. 50–60Hz ±6%

Turn-on voltage
Typ. 80Vac Steady-state value, see Fig. 3-1

Shut-down voltage
Typ. 70Vac Steady-state value, see Fig. 3-1
Typ. 55Vac Dynamic value for maximal 250ms

External input protection
See recommendations in chapter 24.3.

---

</table>

Instructions for DC use:

a) Use a battery or a similar DC source. A supply from the intermediate DC-bus of a frequency converter is not recommended and can cause a malfunction or damage the unit.
b) Connect +pole to L and –pole to N.
c) Connect the PE terminal to an earth wire or to the machine ground.

All values are typical at 24V, 10A, 230Vac, 50Hz, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
5. Input Inrush Current

An active inrush limitation circuit (NTCs, which are bypassed by a relay contact) limits the input inrush current after turn-on of the input voltage.

The charging current into EMI suppression capacitors is disregarded in the first microseconds after switch-on.

## 6. OUTPUT

### Output voltage
- **Nom.**: 24V

### Adjustment range
- **Min.**: 24-28V
- **Max.**: 30.0V

This is the maximum output voltage which can occur at the clockwise end position of the potentiometer due to tolerances. It is not a guaranteed value which can be achieved.

### Factory settings
- **Typ.**: 24.1V

±0.2%, at full load and cold unit

### Line regulation
- **Max.**: 10mV

Between 85 and 300Vac

### Load regulation
- **Max.**: 50mV

Between 0 and 12A, static value, see Fig. 6-1

### Ripple and noise voltage
- **Max.**: 50mVpp

Bandwidth 20Hz to 20MHz, 50Ohm

### Output current
- **Nom.**
  - 12A\(^1\) at 24V and an ambient temperature below 45°C, see Fig. 16-1
  - 10A at 24V and 60°C ambient temperature, see Fig. 6-1
  - 7.5A at 24V and 70°C ambient temperature, see Fig. 16-1
  - 10.3A\(^1\) at 28V and an ambient temperature below 45°C, see Fig. 16-1
  - 8.6A at 28V and 60°C ambient temperature, see Fig. 6-1
  - 6.45A at 28V and 70°C ambient temperature, see Fig. 16-1
  - Typ. 30A for minimal 12ms once every five seconds, see Fig. 6-2.

- **Typ.**: 30A for minimal 12ms once every five seconds, see Fig. 6-2.

The output voltage stays above 20V. See chapter 24.1 for more peak current measurements. For AC 100V mains, the pulse length is shorter than 12ms.

### Overload behaviour
- **Continuous current**
- **Hiccup\(^{\text{PLUS}}\) mode\(^2\)**

<table>
<thead>
<tr>
<th>Overload behaviour</th>
<th>Continuous current</th>

<td>Up to 12ms, load impedance &lt;45Ohm, see Fig. 6-2</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Output capacitance
- **Typ.**: 4 400μF

Included inside the power supply

1) **Power Boost**
This power/ current is continuously allowed up to an ambient temperature of 45°C.
Above 45°C, do not use this power or current longer than a duty cycle of 10% and/ or not longer than 1 minute every 10 minutes.

2) **Hiccup\(^{\text{PLUS}}\) Mode**
At heavy overloads (when output voltage falls below 13V), the power supply delivers continuous output current for 2s. After this, the output is switched off for approx. 18s before a new start attempt is automatically performed. This cycle is repeated as long as the overload exists. If the overload has been cleared, the device will operate normally. See Fig. 6-3

3) Discharge current of output capacitors is not included.

---

All values are typical at 24V, 10A, 230Vac, 50Hz, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.

---

All values are typical at 24V, 10A, 230Vac, 50Hz, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
10. LIFETIME EXPECTANCY

The Lifetime expectancy shown in the table indicates the minimum operating hours (service life) and is determined by the lifetime expectancy of the built-in electrolytic capacitors. Lifetime expectancy is specified in operational hours and is calculated according to the capacitor's manufacturer specification. The manufacturer of the electrolytic capacitors only guarantees a maximum life of up to 15 years (131 400h). Any number exceeding this value is a calculated theoretical lifetime which can be used to compare devices.

<table>

</tbody>
</table>

11. MTBF

MTBF stands for Mean Time Between Failure, which is calculated according to statistical device failures, and indicates reliability of a device. It is the statistical representation of the likelihood of a unit to fail and does not necessarily represent the life of a product.

The MTBF figure is a statistical representation of the likelihood of a device to fail. A MTBF figure of e.g. 1 000 000h means that statistically one unit will fail every 100 hours if 10 000 units are installed in the field. However, it can not be determined if the failed unit has been running for 50 000h or only for 100h.

For these types of units the MTTF (Mean Time To Failure) value is the same value as the MTBF value.

**Instructions for wiring:**

a) Use appropriate copper cables that are designed for minimum operating temperatures of:
   - 60°C for ambient up to 45°C and
   - 75°C for ambient up to 60°C and
   - 90°C for ambient up to 70°C minimum.

b) Follow national installation codes and installation regulations!

c) Ensure that all strands of a stranded wire enter the terminal connection!

d) Unused terminal compartments should be securely tightened.

e) Ferrules are allowed.

---

All values are typical at 24V, 10A, 230Vac, 50Hz, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
Daisy Chaining:
Daisy chaining is allowed for CP10.241, CP10.241-C1, CP10.241-S1 and CP10.242.
Daisy chaining is not allowed for CP10.241-S2.
Daisy chaining (jumping from one power supply output to the next) is allowed as long as the average output current through one terminal pin does not exceed 25A. If the current is higher, use a separate distribution terminal block as shown in Fig. 12-2.

C Output voltage potentiometer
Open the flap to adjust the output voltage. Factory set: 24.1V

D DC-OK LED (green)
On, when the output voltage is in range and the DC-OK contact is closed.

E DC-OK Relay Contact (push-in terminals)
Monitors the output voltage of the running power supply. See chapter 8 for details.

All values are typical at 24V, 10A, 230Vac, 50Hz, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
15. EMC

The power supply is suitable for applications in industrial environment as well as in residential, commercial and light industry environments.

**EMC Immunity**

According to generic standards: EN 61000-6-1 and EN 61000-6-2

16. ENVIRONMENT

Operational temperature  
-25°C to +70°C (-13°F to 158°F)  
Reduce output power according to Fig. 16-1

Storage temperature  
-40°C to +85°C (-40°F to 185°F)  
For storage and transportation

Output de-rating  
3.2W/°C  
6W/°C  
Between +45°C and +60°C (113°F to 140°F)  
Between +60°C and +70°C (140°F to 158°F)

Humidity  
5 to 95% r.h.  
According to IEC 60068-2-30  
Do not energize while condensation is present.

Vibration sinusoidal  
2-17.8Hz: ±1.6mm; 17.8-500Hz: 2g  
2 hours / axis  
According to IEC 60068-2-6

Shock  
30g 6ms, 20g 11ms  
3 bumps / direction, 18 bumps in total  
According to IEC 60068-2-27

Altitude  
0 to 2000m (0 to 6 560ft)  
2000 to 6000m (6 560 to 20 000ft)  
Reduce output power or ambient temperature, see Fig. 16-2.

Altitude de-rating  
15W/1000m or 5°C/1000m  
Above 2000m (6500ft), see Fig. 16-2

Over-voltage category  
III  
According to IEC 62477-1 for altitudes up to 2000m

II  
According to IEC 62477-1 for altitudes from 2000m to 6000m

Degree of pollution  
2  
According to IEC 62477-1, not conductive

LABS compatibility  
The unit does not release any silicone or other LABS-critical substances and is suitable for use in paint shops.

Corrosive gases  
ISA-71.04-1985, Severity Level G3, IEC 60068-2-60 Test Ke Method 4

Audible noise  
Some audible noise may be emitted from the power supply during no load, overload or short circuit.

1) Operational temperature is the same as the ambient or surrounding temperature and is defined as the air temperature 2cm below the unit.
2) Tested in combination with DIN-Rails according to EN 60715 with a height of 15mm and a thickness of 1.3mm and standard orientation.

---

**Fig. 16-1** Output current vs. ambient temp.

**Fig. 16-2** Output current vs. altitude

---

All values are typical at 24V, 10A, 230Vac, 50Hz, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
### 17. PROTECTION FEATURES

**Output protection**
- Electronically protected against overload, no-load and short-circuits. In case of a protection event, audible noise may occur.

**Output over-voltage protection**
- Typ. 30.5Vdc
- Max. 32Vdc
- In case of an internal power supply defect, a redundant circuit limits the maximum output voltage. The output shuts down and automatically attempts to restart.

**Degree of protection**
- IP 20
- EN/IEC 60529

**Penetration protection**
- > 4mm
- E.g. screws, small parts

**Over-temperature protection**
- Yes
- Output shut-down with automatic restart.
- The temperature sensor is installed on critical components inside the unit and turns the unit off in safety critical situations, which can happen e.g. when de-rating requirements are not observed, ambient temperature is too high, ventilation is obstructed or the de-rating requirements for different mounting orientation is not followed. There is no correlation between the operating temperature and turn-off temperature since this is dependent on input voltage, load and installation methods.

**Input transient protection**
- MOV (Metal Oxide Varistor)
- For protection values see chapter 15 (EMC).

**Internal input fuse**
- Included
- Not user replaceable slow-blow high-braking capacity fuse

### 18. SAFETY FEATURES

**Input / output separation**
- Double or reinforced galvanic isolation
  - SELV
  - IEC/EN 60950-1
  - PELV
  - IEC/EN 60204-1, EN 62477-1, IEC 60364-4-41

**Class of protection**
- I
- PE (Protective Earth) connection required

**Isolation resistance**
- > 500MΩhm
  - At delivered condition between input and output, measured with 500Vdc
- > 500MΩhm
  - At delivered condition between input and PE, measured with 500Vdc
- > 500MΩhm
  - At delivered condition between output and PE, measured with 500Vdc
- > 500MΩhm
  - At delivered condition between output and DC-OK contacts, measured with 500Vdc

**PE resistance**
- < 0.1Ωhm
  - Resistance between PE terminal and the housing in the area of the DIN-rail mounting bracket.

**Touch current (leakage current)**
- Typ. 0.14mA / 0.36mA
  - At 100Vac, 50Hz, TN-, TT-mains / IT-mains
- Typ. 0.20mA / 0.50mA
  - At 120Vac, 60Hz, TN-, TT-mains / IT-mains
- Typ. 0.33mA / 0.86mA
  - At 230Vac, 50Hz, TN-, TT-mains / IT-mains
- Max. 0.18mA / 0.43mA
  - At 110Vac, 50Hz, TN-, TT-mains / IT-mains
- Max. 0.26mA / 0.61mA
  - At 132Vac, 60Hz, TN-, TT-mains / IT-mains
- Max. 0.44mA / 1.05mA
  - At 264Vac, 50Hz, TN-, TT-mains / IT-mains
19. DIELECTRIC STRENGTH

The output voltage is floating and has no ohmic connection to the ground. Type and factory tests are conducted by the manufacturer. Field tests may be conducted in the field using the appropriate test equipment which applies the voltage with a slow ramp (2s up and 2s down). Connect all input-terminals together as well as all output poles before conducting the test. When testing, set the cut-off current settings to the value in the table below.

![Diagram](image)

<table>

</tr>
</tbody>
</table>

To fulfil the PELV requirements according to EN60204-1 § 6.4.1, we recommend that either the + pole, the – pole or any other part of the output circuit shall be connected to the protective earth system. This helps to avoid situations in which a load starts unexpectedly or can not be switched off when unnoticed earth faults occur.

B*) When testing input to DC-OK ensure that the max. voltage between DC-OK and the output is not exceeded (column D). We recommend connecting DC-OK pins and the output pins together when performing the test.

23. ACCESSORIES

23.1. ZM4.WALL – WALL/PANEL MOUNT BRACKET

This bracket is used to mount the devices on a wall/panel without utilizing a DIN-Rail. It is suitable for the CP10.241, CP10.241-C1, CP10.241-S1, CP10.241-S2 and CP10.242. The bracket can be mounted without detaching the DIN-rail brackets.

Fig. 23-2 Isometric view (Picture shows the CP10.241)
Fig. 23-3 Isometric view (Picture shows the CP10.241)
Fig. 23-4 Wall/panel mounting, front view (Picture shows the CP10.241)
Fig. 23-5 Hole pattern for wall mounting
Fig. 23-6 Wall/panel mounting, side view (Picture shows the CP10.241)
23.2. ZM12.SIDE - Side Mounting Bracket

This bracket is used to mount the power supply sideways with or without utilizing a DIN-Rail.

The two aluminum brackets and the black plastic slider of the unit have to be detached, so that the steel brackets can be mounted.

For sideway DIN-rail mounting, the removed aluminum brackets and the black plastic slider need to be mounted on the steel bracket.

![Fig. 23-7 Side mounting without DIN-rail brackets (Picture shows the CP10.241)]

![Fig. 23-9 Mounting Dimensions Side mounting bracket]
23.3. YR20.242 - REDUNDANCY MODULE

The redundancy module YR20.242 is equipped with two input channels, which are individually decoupled by utilizing MOSFET technology. Using MOSFETs instead of diodes reduces the heat generation and the voltage drop between input and output. The YR20.242 does not require an additional auxiliary voltage and is self-powered even in case of a short circuit across the output.

Due to the low power losses, the unit is very slender and only requires 32mm width on the DIN-rail.

The YR20.242 can be used for N+1 and 1+1 redundancy systems.

Further information and wiring configurations can be found in chapter 24.7.

23.4. YR20.246 - REDUNDANCY MODULE WITH AUTOMATED LOAD SHARING

The redundancy module YR20.246 is equipped with two input channels, which are individually decoupled by utilizing MOSFET technology. Using MOSFETs instead of diodes reduces the heat generation and the voltage drop between input and output. The YR20.246 does not require an additional auxiliary voltage and is self-powered even in case of a short circuit across the output.

Due to the low power losses, the unit is very slender and only requires 32mm width on the DIN-rail.

The YR20.246 is optimized for 1+1 redundancy systems.

Compared to the YR20.242, the YR20.246 is featured with an automated load sharing between the connected power supplies. The YR20.246 monitors the function of the redundancy circuitry and provides a signal in case of too high of output current, which could prevent redundancy, if one power supply fails.

Further information and wiring configurations can be found in chapter 24.7.
24. APPLICATION NOTES

24.1. PEAK CURRENT CAPABILITY

The unit can deliver peak currents (up to several milliseconds) which are higher than the specified short term currents. This helps to start current demanding loads. Solenoids, contactors and pneumatic modules often have a steady state coil and a pick-up coil. The inrush current demand of the pick-up coil is several times higher than the steady-state current and usually exceeds the nominal output current (including the PowerBoost). The same situation applies when starting a capacitive load.

The peak current capability also ensures the safe operation of subsequent circuit breakers of load circuits. The load branches are often individually protected with circuit breakers or fuses. In case of a short or an overload in one branch circuit, the fuse or circuit breaker need a certain amount of over-current to open in a timely manner. This avoids voltage loss in adjacent circuits.

The extra current (peak current) is supplied by the power converter and the built-in large sized output capacitors of the power supply. The capacitors get discharged during such an event, which causes a voltage dip on the output. The following two examples show typical voltage dips for resistive loads:

<table>
<thead>
<tr>
<th>Peak current voltage dips</th>
<th>20A peak current for 50ms, typ. (2x the nominal current)</th>
<th>50A peak current for 5ms, typ. (5x the nominal current)</th>

</table>

Please note: The DC-OK relay triggers when the voltage dips more than 10% for longer than 1ms.

All values are typical at 24V, 10A, 230Vac, 50Hz, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
24.2. BACK-FEEDING LOADS

Loads such as decelerating motors and inductors can feed voltage back to the power supply. This feature is also called return voltage immunity or resistance against Back-E.M.F. (Electro Magnetic Force).

This power supply is resistant and does not show malfunctioning when a load feeds back voltage to the power supply. It does not matter whether the power supply is on or off.

The maximum allowed feed-back-voltage is 35Vdc. The maximum allowed feed-back peak current is 40A. Higher currents can temporarily shut-down the output voltage. The absorbing energy can be calculated according to the built-in large sized output capacitor which is specified in chapter 6.

24.3. EXTERNAL INPUT PROTECTION

The unit is tested and approved for branch circuits up to 30A (UL) and 32A (IEC). An external protection is only required if the supplying branch has an ampacity greater than this. Check also local codes and local requirements. In some countries local regulations might apply.

If an external fuse is necessary or utilized, minimum requirements need to be considered to avoid nuisance tripping of the circuit breaker. A minimum value of 6A B- or C-Characteristic breaker should be used.

24.4. OUTPUT CIRCUIT BREAKERS

Standard miniature circuit breakers (MCB’s or UL 1077 circuit breakers) are commonly used for AC-supply systems and may also be used on 24V branches.

MCB’s are designed to protect wires and circuits. If the ampere value and the characteristics of the MCB are adapted to the wire size that is used, the wiring is considered as thermally safe regardless of whether the MCB opens or not.

To avoid voltage dips and under-voltage situations in adjacent 24V branches which are supplied by the same source, a fast (magnetic) tripping of the MCB is desired. A quick shutdown within 10ms is necessary corresponding roughly to the ride-through time of PLC’s. This requires power supplies with high current reserves and large output capacitors.

Furthermore, the impedance of the faulty branch must be sufficiently small in order for the current to actually flow.

The best current reserve in the power supply does not help if Ohm’s law does not permit current flow. The following table has typical test results showing which B- and C-Characteristic MCBs magnetically trip depending on the wire cross section and wire length.

<table>
<thead>
<tr>
<th>Maximal wire length for a fast (magnetic) tripping:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.75mm²</td>
</tr>

</tr>
<tr>
<td>B-13A</td>
</tr>
</tbody>
</table>

*) Don’t forget to consider twice the distance to the load (or cable length) when calculating the total wire length (+ and – wire).

All values are typical at 24V, 10A, 230Vac, 50Hz, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
24.5. SERIES OPERATION

Power supplies of the same type can be connected in series for higher output voltages. It is possible to connect as many units in series as needed, providing the sum of the output voltage does not exceed 150Vdc. Voltages with a potential above 60Vdc are not SELV any more and can be dangerous. Such voltages must be installed with a protection against touching.

Earthing of the output is required when the sum of the output voltage is above 60Vdc.

Avoid return voltage (e.g. from a decelerating motor or battery) which is applied to the output terminals.

Restrictions:
Keep an installation clearance of 15mm (left / right) between two power supplies and avoid installing the power supplies on top of each other.
Do not use power supplies in series in mounting orientations other than the standard mounting orientation (terminals on bottom of the unit).
Pay attention that leakage current, EMI, inrush current, harmonics will increase when using multiple power supplies.

24.6. PARALLEL USE TO INCREASE OUTPUT POWER

CP10.241 power supplies can be paralleled to increase the output power. The output voltage of all power supplies shall be adjusted to the same value (±100mV) with the same load conditions on all units, or the units can be left with the factory settings. There is no feature included which balances the load current between the power supplies. Usually the power supply with the higher adjusted output voltage draws current until it goes into current limitation. This means no harm to this power supply as long as the ambient temperature stays below 40°C.

If more than three units are connected in parallel, a fuse or circuit breaker with a rating of 15A or 16A is required on each output. Alternatively, a diode or redundancy module can also be utilized.

Energize all units at the same time to avoid the overload HiccupPLUS mode. It also might be necessary to cycle the input power (turn-off for at least five seconds), if the output was in HiccupPLUS mode due to overload or short circuits and the required output current is higher than the current of one unit.

Restrictions:
Keep an installation clearance of 15mm (left / right) between two power supplies and avoid installing the power supplies on top of each other.
Do not use power supplies in parallel in mounting orientations other than the standard mounting orientation (terminals on bottom of the unit) or in any other condition where a derating of the output current is required (e.g. altitude, ...).
Pay attention that leakage current, EMI, inrush current, harmonics will increase when using multiple power supplies.
24.7. **Parallel Use for Redundancy**

**1+1 Redundancy:**
Power supplies can be paralleled for redundancy to gain higher system availability. Redundant systems require a certain amount of extra power to support the load in case one power supply unit fails. The simplest way is to put two power supplies in parallel. This is called a 1+1 redundancy. In case one power supply unit fails, the other one is automatically able to support the load current without any interruption. It is essential to use a redundancy module to decouple power supplies from each other. This prevents that the defective unit becomes a load for the other power supplies and the output voltage cannot be maintained anymore.

Optionally to the use of external redundancy modules, power supplies with built-in redundancy CP10.241-R1 (spring-clamp terminals), the CP10.241-R2 (plug connectors for hot swap) or the CP10.241-R3 (screw terminals) can be used.

Recommendations for building redundant power systems:
- Use separate input fuses for each power supply.
- Monitor the individual power supply units. Therefore, use the DC-OK relay contact of the power supply.
- It is desirable to set the output voltages of all units to the same value (± 100mV) or leave it at the factory setting.

Pay attention that leakage current, EMI, inrush current, harmonics will increase when using multiple power supplies.

Wiring examples for 1+1 redundancy:

**N+1 Redundancy:**
Redundant systems for a higher power demand are usually built in a N+1 method. E.g. four power supplies, each rated for 10A are paralleled to build a 30A redundant system.

Pay attention that leakage current, EMI, inrush current, harmonics will increase when using multiple power supplies.

Keep an installation clearance of 15mm (left / right) between two power supplies and avoid installing the power supplies on top of each other.

Do not use power supplies in parallel in mounting orientations other than the standard mounting orientation or in any other condition, where a derating of the output current is required.
24.8. **INDUCTIVE AND CAPACITIVE LOADS**

The unit is designed to supply any kind of loads, including capacitive and inductive loads. If extreme large capacitors, such as EDLCs (electric double layer capacitors or "UltraCaps") with a capacitance larger than 1.5F are connected to the output, the unit might charge the capacitor in the HiccupPLUS mode (see chapter 6).

24.9. **CHARGING OF BATTERIES**

The power supply can be used to charge lead-acid or maintenance free batteries (SLA or VRLA batteries). Two 12V batteries are needed in series.

**Instructions for charging batteries:**

a) Set output voltage (measured at no load and at the battery end of the cable) very precisely to the end-of-charge voltage.

<table>
<thead>
<tr>
<th>End-of-charge voltage</th>
<th>27.8V</th>
<th>27.5V</th>
<th>27.15V</th>
<th>26.8V</th>
</tr>
</thead>
<tbody>
<tr>
<td>Battery temperature</td>
<td>10°C</td>
<td>20°C</td>
<td>30°C</td>
<td>40°C</td>
</tr>
</tbody>
</table>

b) Use a 15A or 16A circuit breaker (or blocking diode) between the power supply and the battery.

c) Ensure that the output current of the power supply is below the allowed charging current of the battery.

d) Use only matched batteries when putting 12V types in series.

e) Ensure that the ambient temperature of the power supply stays below 40°C.

f) The return current to the power supply (battery discharge current is typ. 3.5mA when the power supply is switched off (except in case a blocking diode is utilized).
24.10. **OPERATION ON TWO PHASES**

The power supply can also be used on two-phases of a three-phase system. Such a phase-to-phase connection is allowed as long as the supplying voltage is below 240V+10%.

24.11. **USE IN A TIGHTLY SEALED ENCLOSURE**

When the power supply is installed in a tightly sealed enclosure, the temperature inside the enclosure will be higher than outside. In such situations, the inside temperature defines the ambient temperature for the power supply. The following measurement results can be used as a reference to estimate the temperature rise inside the enclosure. The power supply is placed in the middle of the box, no other heat producing items are inside the box. The temperature sensor inside the box is placed in the middle of the right side of the power supply with a distance of 1cm.

24.12. MOUNTING ORIENTATIONS

Mounting orientations other than all terminals on the bottom require a reduction in continuous output power or a limitation in the maximum allowed ambient temperature. The amount of reduction influences the lifetime expectancy of the power supply. Therefore, two different derating curves for continuous operation can be found below:

- **Curve A1**: Recommended output current.
- **Curve A2**: Max allowed output current (results in approximately half the lifetime expectancy of A1).

![Fig. 24-8](image1)
Mounting Orientation A (Standard orientation)
