The DIMENSION CP-Series units are high-end power supplies in a medium price range without compromising quality, reliability and performance. The CP-Series is part of the DIMENSION power supply family. The most outstanding features of CP10.361 are the high efficiency, advanced inrush current limitation, active PFC and the wide operational temperature range.

The CP-Series includes all the essential basic functions. The devices have a power reserve of 20% included, which may even be used continuously at temperatures up to +45°C. Additionally, the CP10 can deliver three times the nominal output current for at least 12ms which helps to trip fuses on faulty output branches.

High immunity to transients and power surges as well as low electromagnetic emission, a DC-OK relay contact and a large international approval package for a variety of applications makes this unit suitable for nearly every situation.

### SHORT-FORM DATA

- **Output voltage**: DC 36V
- **Adjustment range**: 36 – 42V Factory setting 36.0V
- **Output current**: 8.0-6.8A Below +45°C ambient
  - 6.7-5.7A At +60°C ambient
  - 5.0-4.3A At +70°C ambient
- **Input voltage AC**: AC 100-240V -15%/ +10%
- **Mains frequency**: 50-60Hz ±6%
- **Input current AC**: 2.16 / 1.13A At 120 / 230Vac
- **Power factor**: 0.99 / 0.97 At 120 / 230Vac
- **Input voltage DC**: DC 110-150V ±20%
- **Input current DC**: 2.35A At 110Vdc
- **Input inrush current**: 6 / 9A pk At 40°C 120 / 230Vac
- **Efficiency**: 93.8 / 95.4% At 120 / 230Vac
- **Losses**: 15.9 / 11.6W At 120 / 230Vac
- **Hold-up time**: 38 / 38ms At 120 / 230Vac
- **Temperature range**: -25°C to +70°C
- **Size (w x h x d)**: 39x124x117mm Without DIN-Rail
- **Weight**: 600g / 1.3lb

### ORDER NUMBERS

- **Power Supply**: CP10.361
- **Mechanical Accessory**: ZM4.WALL Wall/panel mount bracket
  - ZM12.SIDE Side mount bracket

### MARKINGS

The information given in this document is correct to the best of our knowledge and experience at the time of publication. If not expressly agreed otherwise, this information does not represent a warranty in the legal sense of the word. As the state of our knowledge and experience is constantly changing, the information in this data sheet is subject to revision. We therefore kindly ask you to always use the latest issue of this document (available under www.pulspower.com).

No part of this document may be reproduced or utilized in any form without our prior permission in writing.

TERMINOLOGY AND ABREVIATIONS

PE and symbol PE is the abbreviation for Protective Earth and has the same meaning as the symbol ⚡.
Earth, Ground This document uses the term “earth” which is the same as the U.S. term “ground”.
T.b.d. To be defined, value or description will follow later.
AC 230V A figure displayed with the AC or DC before the value represents a nominal voltage with standard tolerances (usually ±15%) included.
E.g.: DC 12V describes a 12V battery disregarding whether it is full (13.7V) or flat (10V)
230Vac A figure with the unit (Vac) at the end is a momentary figure without any additional tolerances included.
50Hz vs. 60Hz As long as not otherwise stated, AC 100V and AC 230V parameters are valid at 50Hz mains frequency. AC 120V parameters are valid for 60Hz mains frequency.
may A key word indicating flexibility of choice with no implied preference.
shall A key word indicating a mandatory requirement.
should A key word indicating flexibility of choice with a strongly preferred implementation.

All parameters are specified at 36V, 6.7A, 230Vac, 50Hz, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
1. INTENDED USE

This device is designed for installation in an enclosure and is intended for the general professional use such as in industrial control, office, communication, and instrumentation equipment. Do not use this power supply in equipment, where malfunction may cause severe personal injury or threaten human life.

2. INSTALLATION REQUIREMENTS

This device may only be installed and put into operation by qualified personnel. This device does not contain serviceable parts. The tripping of an internal fuse is caused by an internal defect. If damage or malfunction should occur during installation or operation, immediately turn power off and send unit to the factory for inspection.

Mount the unit on a DIN-rail so that the input terminals are located on the bottom of the unit. For other mounting orientations see de-rating requirements in this document. See chapter 24.12.

This device is designed for convection cooling and does not require an external fan. Do not obstruct airflow and do not cover ventilation grid (e.g. cable conduits) by more than 15%!

Keep the following installation clearances: 40mm on top, 20mm on the bottom, 5mm on the left and right sides are recommended when the device is loaded permanently with more than 50% of the rated power. Increase this clearance to 15mm in case the adjacent device is a heat source (e.g. another power supply).

A disconnecting means shall be provided for the output of the power supplies when used in applications according to CSA C22.2 No 107.1-01.

WARNING

Risk of electrical shock, fire, personal injury or death.
- Do not use the power supply without proper grounding (Protective Earth). Use the terminal on the input block for earth connection and not one of the screws on the housing.
- Turn power off before working on the device. Protect against inadvertent re-powering.
- Make sure that the wiring is correct by following all local and national codes.
- Do not modify or repair the unit.
- Do not open the unit as high voltages are present inside.
- Use caution to prevent any foreign objects from entering the housing.
- Do not use in wet locations or in areas where moisture or condensation can be expected.
- Do not touch during power-on, and immediately after power-off. Hot surfaces may cause burns.

Notes for use in hazardous location areas:
The power supply is suitable for use in Class I Division 2 Groups A, B, C, D locations and for use in Group II Category 3 (Zone 2) environments. See section 20 for details.

WARNING EXPLOSION HAZARDS!
Substitution of components may impair suitability for this environment. Do not disconnect the unit or operate the voltage adjustment or S/P jumper unless power has been switched off or the area is known to be non-hazardous.
A suitable enclosure must be provided for the end product which has a minimum protection of IP54 and fulfils the requirements of the EN 60079-15:2010.
3. AC-INPUT

AC input Nom. AC 100-240V Suitable for TN-, TT- and IT mains networks
AC input range Min. 85-264Vac Continuous operation
Min. 264-300Vac For maximal 500ms
Allowed voltage L or N to earth Max. 300Vac Continuous according to IEC 62477-1
Input frequency Nom. 50–60Hz ±6%
Turn-on voltage Typ. 80Vac Steady-state value, see Fig. 3-1
Shut-down voltage Typ. 70Vac Steady-state value, see Fig. 3-1
Typ. 55Vac Dynamic value for maximal 250ms

External input protection See recommendations in chapter 24.3.

Instructions for DC use:

a) Use a battery or a similar DC source. A supply from the intermediate DC-bus of a frequency converter is not recommended and can cause a malfunction or damage the unit.

b) Connect +pole to L and –pole to N.

c) Connect the PE terminal to an earth wire or to the machine ground.
5. **Input Inrush Current**

An active inrush limitation circuit (NTCs, which are bypassed by a relay contact) limits the input inrush current after turn-on of the input voltage.

The charging current into EMI suppression capacitors is disregarded in the first microseconds after switch-on.

</tbody>
</table>

1) **Power Boost**  
This power/current is continuously allowed up to an ambient temperature of 45°C.  
Above 45°C, do not use this power/current longer than a duty cycle of 10% and/or not longer than 1 minute every 10 minutes.

2) **Hiccup<sup>PLUS</sup> Mode**  
At heavy overloads (when output voltage falls below 20V), the power supply delivers continuous output current for 2s. After this, the output is switched off for approx. 18s before a new start attempt is automatically performed. This cycle is repeated as long as the overload exists. If the overload has been cleared, the device will operate normally. See Fig. 6-3

3) Discharge current of output capacitors is not included.

Fig. 7-2 Shut-down behavior, definitions
8. DC-OK RELAY CONTACT

This feature monitors the output voltage on the output terminals of a running power supply.

| Contact closes | As soon as the output voltage reaches typ. 90% of the adjusted output voltage level. |
| Contact opens | As soon as the output voltage dips more than 10% below the adjusted output voltage. Short dips will be extended to a signal length of 100ms. Dips shorter than 1ms will be ignored. |
| Switching hysteresis | Typ. 1.5V |
| Contact ratings | Maximal 60Vdc 0.3A, 30Vdc 1A, 30Vac 0.5A, resistive load |
| Minimal permissible load: 1mA at 5Vdc |
| Isolation voltage | See dielectric strength table in section 18. |

Fig. 8-1  DC-ok relay contact behavior

---

All parameters are specified at 36V, 6.7A, 230Vac, 50Hz, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.

10. LIFETIME EXPECTANCY

The Lifetime expectancy shown in the table indicates the minimum operating hours (service life) and is determined by the lifetime expectancy of the built-in electrolytic capacitors. Lifetime expectancy is specified in operational hours and is calculated according to the capacitor’s manufacturer specification. The manufacturer of the electrolytic capacitors only guarantees a maximum life of up to 15 years (131 400h). Any number exceeding this value is a calculated theoretical lifetime which can be used to compare devices.

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Lifetime expectancy 150 000h</th>

</tr>
</tbody>
</table>

11. MTBF

MTBF stands for Mean Time Between Failure, which is calculated according to statistical device failures, and indicates reliability of a device. It is the statistical representation of the likelihood of a unit to fail and does not necessarily represent the life of a product.

The MTBF figure is a statistical representation of the likelihood of a device to fail. A MTBF figure of e.g. 1 000 000h means that statistically one unit will fail every 100 hours if 10 000 units are installed in the field. However, it cannot be determined if the failed unit has been running for 50 000h or only for 100h.

<table>

Instructions:

a) Use appropriate copper cables that are designed for minimum operating temperatures of:
   - 60°C for ambient up to 45°C and
   - 75°C for ambient up to 60°C and
   - 90°C for ambient up to 70°C minimum.

b) Follow national installation codes and installation regulations!

c) Ensure that all strands of a stranded wire enter the terminal connection!

d) Unused terminal compartments should be securely tightened.

e) Ferrules are allowed.

Daisy chaining:

Daisy chaining (jumping from one power supply output to the next) is allowed as long as the average output current through one terminal pin does not exceed 25A. If the current is higher, use a separate distribution terminal block as shown in Fig. 13-2.

---

All parameters are specified at 36V, 6.7A, 230Vac, 50Hz, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
14. FRONT SIDE AND USER ELEMENTS

Fig. 14-1
Front side

A  Input Terminals
Screw terminals
N, L  Line input
⊕  PE (Protective Earth) input

B  Output Terminals
(two identical + poles and three identical - poles)
Screw terminals
+  Positive output
-  Negative (return) output

C  Output voltage potentiometer
Open the flap to adjust the output voltage. Factory set: 36.0V

D  DC-OK LED (green)
On, when the output voltage is >90% of the adjusted output voltage

E  DC-OK Relay Contact
(spring-clamp terminals)
Monitors the output voltage of the running power supply. See chapter 8 for details.
## 15. EMC

The power supply is suitable for applications in industrial environment as well as in residential, commercial and light industry environments.

### EMC Immunity

According to generic standards: EN 61000-6-1 and EN 61000-6-2

16. ENVIRONMENT

Operational temperature: 
-25°C to +70°C (-13°F to 158°F) Reduce output power according to Fig. 16-1

Storage temperature: 
-40°C to +85°C (-40°F to 185°F) For storage and transportation

Output de-rating: 
3.2W/°C Between +45°C and +60°C (113°F to 140°F)
6W/°C Between +60°C and +70°C (140°F to 158°F)

Humidity: 5 to 95% r.h. According to IEC 60068-2-30

Vibration sinusoidal: 2-17.8Hz: ±1.6mm; 17.8-500Hz: 2g According to IEC 60068-2-6

Shock: 30g 6ms, 20g 11ms According to IEC 60068-2-27

Altitude: 
0 to 2000m (0 to 6560ft) Without any restrictions
2000 to 6000m (6560 to 20000ft) Reduce output power or ambient temperature, see Fig. 16-2

Altitude de-rating: 
15W/1000m or 5°C/1000m Above 2000m (6500ft), see Fig. 16-2

Over-voltage category: 
III According to IEC 62477-1 for altitudes up to 2000m
II According to IEC 62477-1 for altitudes from 2000m to 6000m

Degree of pollution: 2 According to IEC 62477-1, not conductive

LABS compatibility: The unit does not release any silicone or other LABS-critical substances and is suitable for use in paint shops.

Corrosive gases: ISA-71.04-1985, Severity Level G3, IEC 60068-2-60 Test Ke Method 4

Audible noise: Some audible noise may be emitted from the power supply during no load, overload or short circuit.

1) Operational temperature is the same as the ambient or surrounding temperature and is defined as the air temperature 2cm below the unit.
2) Tested in combination with DIN-Rails according to EN 60715 with a height of 15mm and a thickness of 1.3mm and standard orientation.

Fig. 16-1 Output current vs. ambient temp.
Fig. 16-2 Output current vs. altitude

All parameters are specified at 36V, 6.7A, 230Vac, 50Hz, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
17. PROTECTION FEATURES

Output protection  
Electronically protected against overload, no-load and short-circuits. In case of a protection event, audible noise may occur.

Output over-voltage protection  
Typ. 46Vdc  
Max. 48Vdc  
In case of an internal power supply defect, a redundant circuit limits the maximum output voltage. The output shuts down and automatically attempts to restart.

Degree of protection  
IP 20  
EN/IEC 60529  
Penetration protection  
> 4mm  
E.g. screws, small parts

Over-temperature protection  
Yes  
Output shut-down with automatic restart. The temperature sensor is installed on critical components inside the unit and turns the unit off in safety critical situations (e.g. de-rating requirements not observed, high ambient temperature, ventilation obstructed or the mounting orientation de-rating is not followed). There is no correlation between the operating temperature and turn-off temperature since this is dependent on input voltage, load and installation methods.

Input transient protection  
MOV (Metal Oxide Varistor)  
For protection values see chapter 15 (EMC).

Internal input fuse  
Included  
Not user replaceable slow-blow high-braking capacity fuse

18. SAFETY FEATURES

Input / output separation  
Double or reinforced galvanic isolation  
SELV  
IEC/EN 60950-1  
PELV  
IEC/EN 60204-1, EN 62477-1, IEC 60364-4-41

Resistance between PE terminal and the housing in the area of the DIN-rail mounting bracket

Touch current (leakage current)  
Typ. 0.14mA / 0.36mA  
At 100Vac, 50Hz, TN-, TT-mains / IT-mains  
Typ. 0.20mA / 0.50mA  
At 120Vac, 60Hz, TN-, TT-mains / IT-mains  
Typ. 0.33mA / 0.86mA  
At 230Vac, 50Hz, TN-, TT-mains / IT-mains  
Max. 0.18mA / 0.43mA  
At 110Vac, 50Hz, TN-, TT-mains / IT-mains  
Max. 0.26mA / 0.61mA  
At 132Vac, 60Hz, TN-, TT-mains / IT-mains  
Max. 0.44mA / 1.05mA  
At 264Vac, 50Hz, TN-, TT-mains / IT-mains

All parameters are specified at 36V, 6.7A, 230Vac, 50Hz, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
19. **Dielectric Strength**

The output voltage is floating and has no ohmic connection to the ground. Type and factory tests are conducted by the manufacturer. Field tests may be conducted in the field using the appropriate test equipment which applies the voltage with a slow ramp (2s up and 2s down). Connect all input-terminals together as well as all output poles before conducting the test. When testing, set the cut-off current settings to the value in the table below.

![Diagram showing input and output connections](image)

</tr>
</tbody>
</table>

To fulfil the PELV requirements according to EN60204-1 § 6.4.1, we recommend that either the + pole, the – pole or any other part of the output circuit shall be connected to the protective earth system. This helps to avoid situations in which a load starts unexpectedly or can not be switched off when unnoticed earth faults occur.

B*) When testing input to DC-OK ensure that the max. voltage between DC-OK and the output is not exceeded (column D). We recommend connecting DC-OK pins and the output pins together when performing the test.
### 20. APPROVALS

**EC Declaration of Conformity**

23. Accessories

23.1. ZM4.WALL – Wall/Panel Mount Bracket

This bracket is used to mount the devices on a wall/panel without utilizing a DIN-Rail. The bracket can be mounted without detaching the DIN-rail brackets.

![Isometric view](image1)
![Isometric view](image2)
![Isometric view](image3)

![Wall/panel mounting, front view](image4)
![Hole pattern for wall mounting](image5)
![Wall/panel mounting, side view](image6)
23.2. **ZM12.SIDE - SIDE MOUNTING BRACKET**

This bracket is used to mount DIMENSION units sideways with or without utilizing a DIN-Rail. The two aluminum brackets and the black plastic slider of the unit have to be detached, so that the steel brackets can be mounted. For sideway DIN-rail mounting, the removed aluminum brackets and the black plastic slider need to be mounted on the steel bracket.

![Side mounting with DIN-rail brackets](image1)

![Side mounting without DIN-rail brackets](image2)
23.3. **REDUNDANCY MODULE**

**YR2.DIODE** – 2x 10A Inputs, 1x 20A output

The YR2.DIODE is a dual redundancy module, which has two diodes as decoupling devices included. It can be used for various purposes. The most popular application is to configure highly reliable and true redundant power supply systems. Another interesting application is the separation of sensitive loads from non-sensitive loads. This avoids the distortion of the power quality for the sensitive loads which can cause controller failures.

The YR2.DIODE does not require an additional auxiliary voltage and is self-powered even in case of a short circuit across the output.

The unit is very slender and only requires 32mm width on the DIN-rail.

**YR40.482** – 2x 20A Inputs, 1x 40A output

The YR40.482 is equipped with two input channels, which are individually decoupled by utilizing MOSFET technology. Using MOSFETs instead of diodes reduces the heat generation and the voltage drop between input and output. The YR40.482 does not require an additional auxiliary voltage and is self-powered even in case of a short circuit across the output.

Due to the low power losses, the unit is very slender and only requires 46mm width on the DIN-rail.

---

**Fig. 23-7** Typical 1+1 Redundant configuration for 6.7A with the YR2.DIODE redundancy module

**Fig. 23-8** Typical 1+1 Redundant configuration for 6.7A with the YR40.482 MOSFET redundancy module
24. APPLICATION NOTES

24.1. PEAK CURRENT CAPABILITY

The unit can deliver peak currents (up to several milliseconds) which are higher than the specified short term currents. This helps to start current demanding loads. Solenoids, contactors and pneumatic modules often have a steady state coil and a pick-up coil. The inrush current demand of the pick-up coil is several times higher than the steady-state current and usually exceeds the nominal output current (including the PowerBoost). The same situation applies when starting a capacitive load.

The peak current capability also ensures the safe operation of subsequent circuit breakers of load circuits. The load branches are often individually protected with circuit breakers or fuses. In case of a short or an overload in one branch circuit, the fuse or circuit breaker need a certain amount of over-current to open in a timely manner. This avoids voltage loss in adjacent circuits.

The extra current (peak current) is supplied by the power converter and the built-in large sized output capacitors of the power supply. The capacitors get discharged during such an event, which causes a voltage dip on the output. The following two examples show typical voltage dips for resistive loads:

![Figure 24-1: 13.4A peak current for 50ms, typ.](image)

![Figure 24-2: 33.5A peak current for 5ms, typ.](image)

![Figure 24-3: 20A peak current for 12ms, typ.](image)

Please note: The DC-OK relay triggers when the voltage dips more than 10% for longer than 1ms.

<table>
<thead>
<tr>
<th>Peak current voltage dips</th>
<th>Typically from 36V to 24.6V</th>

</tr>
<tr>
<td></td>
<td>Typically from 36V to 21.3V</td>
<td>At 33.5A for 5ms, resistive load</td>
</tr>
</tbody>
</table>

All parameters are specified at 36V, 6.7A, 230Vac, 50Hz, 25°C ambient and after a 5 minutes run-in time unless otherwise noted.
24.2. BACK-FEEDING LOADS

Loads such as decelerating motors and inductors can feed voltage back to the power supply. This feature is also called return voltage immunity or resistance against Back- E.M.F. (Electro Magnetic Force).

This power supply is resistant and does not show malfunctioning when a load feeds back voltage to the power supply. It does not matter whether the power supply is on or off.

The maximum allowed feed-back-voltage is 50Vdc. The maximum allowed feed-back peak current is 27A. Higher currents can temporarily shut-down the output voltage. The absorbing energy can be calculated according to the built-in large sized output capacitor which is specified in chapter 6.

24.3. EXTERNAL INPUT PROTECTION

The unit is tested and approved for branch circuits up to 30A (UL) and 32A (IEC). An external protection is only required if the supplying branch has an ampacity greater than this. Check also local codes and local requirements. In some countries local regulations might apply.

If an external fuse is necessary or utilized, minimum requirements need to be considered to avoid nuisance tripping of the circuit breaker. A minimum value of 6A B- or C-Characteristic breaker should be used.

24.4. OUTPUT CIRCUIT BREAKERS

Standard miniature circuit breakers (MCB’s or UL 1077 circuit breakers) are commonly used for AC-supply systems and may also be used on 36V branches.

MCB’s are designed to protect wires and circuits. If the ampere value and the characteristics of the MCB are adapted to the wire size that is used, the wiring is considered as thermally safe regardless of whether the MCB opens or not.

To avoid voltage dips and under-voltage situations in adjacent 36V branches which are supplied by the same source, a fast (magnetic) tripping of the MCB is desired. A quick shutdown within 10ms is necessary corresponding roughly to the ride-through time of PLC’s. This requires power supplies with high current reserves and large output capacitors.

Furthermore, the impedance of the faulty branch must be sufficiently small in order for the current to actually flow. The best current reserve in the power supply does not help if Ohm’s law does not permit current flow. The following table has typical test results showing which B- and C-Characteristic MCBs magnetically trip depending on the wire cross section and wire length.

<table>

</tbody>
</table>

*) Don’t forget to consider twice the distance to the load (or cable length) when calculating the total wire length (+ and – wire).
24.5. **Parallel Use to Increase Output Power**

CP10.361 power supplies can be paralleled to increase the output power. The output voltage of all power supplies shall be adjusted to the same value (±100mV) with the same load conditions on all units, or the units can be left with the factory settings. There is no feature included which balances the load current between the power supplies. Usually the power supply with the higher adjusted output voltage draws current until it goes into current limitation. This means no harm to this power supply as long as the ambient temperature stays below 40°C.

If more than three units are connected in parallel, a fuse or circuit breaker with a rating of 10A is required on each output. Alternatively, a diode or redundancy module can also be utilized.

Energize all units at the same time to avoid the overload Hiccup mode. It also might be necessary to cycle the input power (turn-off for at least five seconds), if the output was in Hiccup mode due to overload or short circuits and the required output current is higher than the current of one unit.

Restrictions:
- Keep an installation clearance of 15mm (left / right) between two power supplies and avoid installing the power supplies on top of each other.
- Do not use power supplies in parallel in mounting orientations other than the standard mounting orientation (terminals on bottom of the unit) or in any other condition where a derating of the output current is required (e.g. altitude, ...).
- Pay attention that leakage current, EMI, inrush current, harmonics will increase when using multiple power supplies.

24.6. **Parallel Use for Redundancy**

Power supplies can be paralleled for redundancy to gain higher system availability. Redundant systems require a certain amount of extra power to support the load in case one power supply unit fails. The simplest way is to put two decoupled power supplies in parallel. This is called a 1+1 redundancy. In case one power supply unit fails, the other one is automatically able to support the load current without any interruption. Redundant systems for a higher power demand are usually built in a N+1 method. E.g. five power supplies, each rated for 6.7A are paralleled to build a 26.8A redundant system. For N+1 redundancy the same restrictions apply as for increasing the output power, see also chapter 24.5.

**Please note:** Always use a redundancy module to decouple power supplies from each other. This prevents that the defective unit becomes a load for the other power supplies and the output voltage cannot be maintained any more. Further information and wiring configurations can be found in chapter 23.3.

Recommendations for building redundant power systems:
- Use separate input fuses for each power supply.
- Monitor the individual power supply units. Therefore, use the DC-OK relay contact of the CP10 power supply.
- It is desirable to set the output voltages of all units to the same value (± 100mV) or leave it at the factory setting.
24.7. **Series Operation**

Power supplies of the same type can be connected in series for higher output voltages. It is possible to connect as many units in series as needed, providing the sum of the output voltage does not exceed 150Vdc. Voltages with a potential above 60Vdc are not SELV any more and can be dangerous. Such voltages must be installed with a protection against touching.

Earthing of the output is required when the sum of the output voltage is above 60Vdc.

Avoid return voltage (e.g. from a decelerating motor or battery) which is applied to the output terminals.

**Restrictions:**
- Keep an installation clearance of 15mm (left / right) between two power supplies and avoid installing the power supplies on top of each other.
- Do not use power supplies in series in mounting orientations other than the standard mounting orientation (terminals on bottom of the unit).
- Pay attention that leakage current, EMI, inrush current, harmonics will increase when using multiple power supplies.

24.8. **Inductive and Capacitive Loads**

The unit is designed to supply any kind of loads, including capacitive and inductive loads. If extreme large capacitors, such as EDLCs (electric double layer capacitors or “UltraCaps”) with a capacitance larger than 0.8F are connected to the output, the unit might charge the capacitor in the HiccupPLUS mode (see chapter 6).

24.9. **Charging of Batteries**

The power supply can be used to charge lead-acid or maintenance free batteries (SLA or VRLA batteries). Three 12V batteries are needed in series.

**Instructions for charging batteries:**

a) Set output voltage (measured at no load and at the battery end of the cable) very precisely to the end-of-charge voltage.

<table>
<thead>
<tr>
<th>End-of-charge voltage</th>
<th>41.7V</th>
<th>41.25V</th>
<th>40.7V</th>
<th>40.2V</th>
</tr>
</thead>
<tbody>
<tr>
<td>Battery temperature</td>
<td>10°C</td>
<td>20°C</td>
<td>30°C</td>
<td>40°C</td>
</tr>
</tbody>
</table>

b) Use a 10A circuit breaker (or blocking diode) between the power supply and the battery.

c) Ensure that the output current of the power supply is below the allowed charging current of the battery.

d) Use only matched batteries when putting 12V types in series.

e) Ensure that the ambient temperature of the power supply stays below 40°C.

f) The return current to the power supply (battery discharge current is typ. 2.5mA when the power supply is switched off (except in case a blocking diode is utilized).
24.10. **Operation on Two Phases**

The power supply can also be used on two-phases of a three-phase-system. Such a phase-to-phase connection is allowed as long as the supplying voltage is below $240V + 10\%$.

![Diagram of phase connections](image)

24.11. **Use in a Tightly Sealed Enclosure**

When the power supply is installed in a tightly sealed enclosure, the temperature inside the enclosure will be higher than outside. In such situations, the inside temperature defines the ambient temperature for the power supply.

The following measurement results can be used as a reference to estimate the temperature rise inside the enclosure. The power supply is placed in the middle of the box, no other heat producing items are inside the box. The temperature sensor inside the box is placed in the middle of the right side of the power supply with a distance of 1cm.

24.12. MOUNTING ORIENTATIONS

Mounting orientations other than all terminals on the bottom require a reduction in continuous output power or a limitation in the maximum allowed ambient temperature. The amount of reduction influences the lifetime expectancy of the power supply. Therefore, two different derating curves for continuous operation can be found below:

**Curve A1**  Recommended output current.
**Curve A2**  Max allowed output current (results in approximately half the lifetime expectancy of A1).
