

C-Series

24V, 20A, 480 W, DC/DC CONVERTER

DC/DC CONVERTER

- 88-360Vdc wide-range input
- Width only 65mm
- Efficiency up to 94.6%
- ATEX and IECEx approved
- Excellent partial load efficiency
- 20% output power reserves (PowerBoost)
- Safe Hiccup^{PLUS} overload mode
- Easy fuse tripping due to high overload current (typ. 80A for 15ms)
- Minimal inrush current surge
- Full power between -25°C and +60°C
- DC-OK relay contact
- Reverse input polarity protected
- Current sharing feature for parallel use
- 3 year warranty

PRODUCT DESCRIPTION

The Dimension C-Series are cost optimized power supplies and DC/DC converters without compromising quality, reliability and performance. The C-Series is part of the DIMENSION power supply family. The most outstanding features of CPS20.241-D1 are the wide DC-input range, high efficiency, electronic inrush current limitation, wide operational temperature range. The small size is achieved by a synchronous rectification and further technological design details.

The C-Series includes all the essential basic functions. The devices also offer PowerBoost: Power reserves of 20%, which may even be used continuously at temperatures up to +45°C. Additionally, the CPS20.241-D1 can deliver about 4 times the nominal output current for 15ms which helps to trip fuses on faulty output branches.

High immunity to transients and power surges as well as low electromagnetic emission, a DC-OK relay contact and a large international approval package for a variety of applications makes this unit suitable for nearly every situation.

SHORT-FORM DATA

Output voltage	DC 24V	
Adjustment range	24 - 28V	
Output current	20.0 – 17.1A	at +60°C ambient
	15.0 – 12.8A	at + 70°C ambient
PowerBoost	24.0 – 20.6A	up to +45°C ambient
Linear decrease to no	ominal power bet	ween +45°C and +60°C
Output ripple	< 50mVpp	20Hz to 20MHz
AC Input voltage	-	=
DC Input voltage	DC 110-300V	± 20%
DC Input current	4.68 / 1.69A	at 110 / 300Vdc
Inrush current	typ. 6 / 4A _{peak}	at 110 / 300Vdc
Efficiency	93.1 / 94.6%	at 110 / 300Vdc
Losses	35.6 / 27.4W	at 110 / 300Vdc
Temperature range	-25°C to +70°C	operational
Derating	12W/°C	+60 to +70°C
Hold-up time	typ. 26 / 26ms	at 110 / 300Vdc
Dimensions	65x124x127mm	WxHxD
Weight	940g

TERMINOLOGY AND ABREVIATIONS

PE and 🕀 symbol	PE is the abbreviation for P rotective E arth and has the same meaning as the symbol $^{\bigoplus}$.
Earth. Ground	This document uses the term "earth" which is the same as the U.S. term "ground".

To be defined, value or description will follow later. t.b.d.

DC 300V A figure displayed with the AC or DC before the value represents a nominal voltage with

standard tolerances (usually ±15%) included.

E.g.: DC 12V describes a 12V battery disregarding whether it is full (13.7V) or flat (10V)

300Vdc A figure with the unit (Vdc) at the end is a momentary figure without any additional

tolerances included.

A key word indicating flexibility of choice with no implied preference. may

shall A key word indicating a mandatory requirement.

should A key word indicating flexibility of choice with a strongly preferred implementation.

Jan. 2025 / Rev. 1.4 DS-CPS20.241-D1-EN

DIMENSION

C-Series

24V, 20A, 480 W, DC/DC CONVERTER

1. INTENDED USE

This device is designed for installation in an enclosure and is intended for commercial use, such as in industrial control, process control, monitoring, measurement equipment or the like.

Do not use this device in equipment, where malfunctioning may cause severe personal injury or threaten human life without additional appropriate safety devices, that are suited for the end-application.

If this device is used in a manner outside of its specification, the protection provided by the device may be impaired.

2. Installation Instructions

WARNING Risk of electrical shock, fire, personal injury or death.

- Turn power off before working on the device and protect against inadvertent re-powering.
- Do not open, modify or repair the device.
- Use caution to prevent any foreign objects from entering into the housing.
- Do not use in wet locations or in areas where moisture or condensation can be expected.
- Do not touch during power-on, and immediately after power-off. Hot surface may cause burns.

Obey the following installation instructions:

This device may only be installed and put into operation by qualified personnel.

This device does not contain serviceable parts. The tripping of an internal fuse is caused by an internal defect.

If damage or malfunction should occur during installation or operation, immediately turn power off and send unit to the factory for inspection.

Install the device in an enclosure providing protection against electrical, mechanical and fire hazards.

Install the device onto a DIN rail according to EN 60715 with the input terminals on the bottom of the device. Other mounting orientations require a reduction in output current.

Make sure that the wiring is correct by following all local and national codes. Use appropriate copper cables that are designed for a minimum operating temperature of 60°C for ambient temperatures up to +45°C, 75°C for ambient temperatures up to +60°C and 90°C for ambient temperatures up to +70°C.

Ensure that all strands of a stranded wire enter the terminal connection. Use ferrules for wires on the input terminals. Unused screw terminals should be securely tightened.

The device is designed for pollution degree 2 areas in controlled environments. No condensation or frost is allowed.

The enclosure of the device provides a degree of protection of IP20. The enclosure does not provide protection against spilled liquids.

The isolation of the devices is designed to withstand impulse voltages up to 2.5kV according to IEC 60664-1.

The device is designed as "Class of Protection I" equipment according to IEC 61140. Do not use without a proper PE (Protective Earth) connection.

The input can be powered from batteries or similar DC sources. The continuous voltage between the input terminals and PE potential must not exceed 360Vdc.

Check for correct input polarity. The device will not operate when the voltage is reversed. A disconnecting means shall be provided for the input of the device.

The device is designed for convection cooling and does not require an external fan. Do not obstruct airflow and do not cover ventilation grid!

The device is designed for altitudes up to 5000m. Above 2000m a reduction in output current is required.

Keep the following minimum installation clearances: 40mm on top, 20mm on the bottom, 5mm left and right side. Increase the 5mm to 15mm in case the adjacent device is a heat source. When the device is permanently loaded with less than 50%, the 5mm can be reduced to zero.

Jan. 2025 / Rev. 1.4 DS-CPS20.241-D1-EN

C-Series

24V, 20A, 480 W, DC/DC CONVERTER

The device is designed, tested and approved for branch circuits up to 32A (IEC) and 30A (UL) without additional protection device. If an external fuse is utilized, do not use circuit breakers smaller than 10A B- or C-Characteristic to avoid a nuisance tripping of the circuit breaker.

The maximum surrounding air temperature is +70°C. The operational temperature is the same as the ambient or surrounding air temperature and is defined 2cm below the device.

The device is designed to operate in areas between 5% and 95% relative humidity.

Installation Instructions for Hazardous Location Areas

The device is suitable for use in Class I Division 2 Groups A, B, C, D locations and for use in Group II Category 3 (Zone 2) environments.

Classification: ATEX: EPS 13 ATEX 1 555 X, II 3G Ex ec nC IIC T3 Gc / IECEx EPS 13.0016X

WARNING EXPLOSION HAZARDS!

Substitution of components may impair suitability for this environment.

Do not disconnect the device or operate the voltage adjustment unless power has been switched off or the area is known to be non-hazardous.

A suitable enclosure must be provided for the end product which has a minimum protection of IP54 and fulfils the requirements of the EN 60079-0.

3. AC-INPUT

Do not operate this DC/DC converter with AC-input voltage. Use the CPS20.241 unit instead.

4. DC-INPUT

Use a battery or a similar DC source. A supply from the intermediate DC-bus of a frequency converter is not recommended and can cause a malfunction or damage the unit.

DC input DC input range	nom.	DC 110-300V 88-360Vdc	
··· /- · · · · · · · · · · · · · · · · · · ·		88-100Vdc	short term or with output derating (1%/V) or with reduced ambient temperature, see also Fig. 15-1, no damage between 0 and 88Vdc
		360-425Vdc	short term, < 500ms
Allowed voltage between input to earth (ground)	max.	360Vdc	continuous, IEC 62103
		± 600V	peak value, allowed for transients
Slew rate for voltage between input to earth (ground)	max.	1000V/μs	
Allowed input ripple voltage	max.	50Vpp	50Hz –10kHz
		15Vpp	10kHz – 50kHz
Turn-on voltage	typ.	85Vdc	steady-state value, see Fig. 4-1

6. OUTPUT

Output voltage	nom.	24V	
Adjustment range		24-28V	guaranteed
	max.	30V****)	at clockwise end position of potentiometer
Factory settings	typ.	24.1V	±0.2%, at full load, cold unit, in "single use" mode
	typ.	24.1V	±0.2%, at full load, cold unit, in "parallel use" mode
	typ.	25.1V	at no load, cold unit, in "parallel use" mode
Line regulation	max.	10mV	88-370Vdc
Load regulation	max.	100mV	in "single use" mode: static value, $0A \rightarrow 20A$; see Fig. 6-1
	typ.	1000mV	in "parallel use" mode: static value, $0A \rightarrow 20A$, see Fig. 6-2
Ripple and noise voltage	max.	70mVpp	20Hz to 20MHz, 50Ohm
Output current	nom.	20A	at 24V, ambient temperature <60°C, see Fig. 6-1
	nom.	24A*)	at 24V, ambient temperature <45°C, see Fig. 6-1
	nom.	17.1A	at 28V, ambient temperature <60°C, see Fig. 6-1
	nom.	20.6A*)	at 28V, ambient temperature <45°C, see Fig. 6-1
	typ.	80A	up to 15ms, output voltage stays above 20V, see Fig. 6-4. This peak current is available once every five seconds. See chapter 22.1 for more peak current measurements.
Output power	nom.	480W	continuously available
	nom.	576W*)	Power Boost®*)
Overload behaviour		cont. current	output voltage > 13Vdc, see Fig. 6-1
		Hiccup ^{PLUS} mode**)	output voltage < 13Vdc, see Fig. 6-1
Short-circuit current	min.	35A***)	load impedance <10mOhm, see Fig. 6-3
	max.	45A***)	load impedance <10mOhm, see Fig. 6-3
	max.	15A***)	average (R.M.S.) current, load impedance 50mOhm, see Fig. 6-3
	min.	70A	< 15ms, load impedance <10mOhm, see Fig. 6-4
	typ.	100A	< 15ms, load impedance <10mOhm, see Fig. 6-4
Output capacitance	typ.	7 000µF	included inside the DC/DC converter

*) Power Boost

This power/ current is continuously allowed up to an ambient temperature of 45°C.

Above 45°C, do not use this power/ current longer than a duty cycle of 10% and/ or not longer than 1 minute every 10 minutes.

**) Hiccup^{PLUS} Mode

At heavy overloads (when output voltage falls below 13V), the DC/DC converter delivers continuous output current for 2s. After this, the output is switched off for approx. 18s before a new start attempt is automatically performed. This cycle is repeated as long as the overload exists. If the overload has been cleared, the device will operate normally. See Fig. 6-3.

****) This is the maximum output voltage which can occur at the clockwise end position of the potentiometer due to tolerances. It is not guaranteed value which can be achieved. The typical value is about 28.5V (in "single use" mode).

Jan. 2025 / Rev. 1.4 DS-CPS20.241-D1-EN

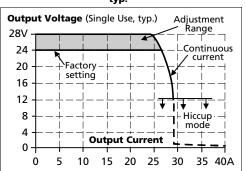

^{***)} Discharge current of output capacitors is not included.

7. HOLD-UP TIME

The internal capacitor, which supplies the energy for the hold-up time is isolated by a diode to the input voltage. A short on the input line does not discharge the internal hold-up capacitor.

		DC 110V	DC 300V	
Hold-up Time	typ.	65ms	65ms	at 24V, 10A, see Fig. 7-1
	min.	54ms	54ms	at 24V, 10A, see Fig. 7-1
	typ.	26ms	26ms	at 24V, 20A, see Fig. 7-1
	min.	21ms	21ms	at 24V, 20A, see Fig. 7-1

Fig. 7-1 Hold-up time vs. input voltage

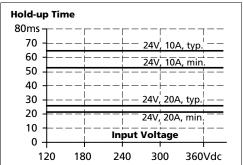

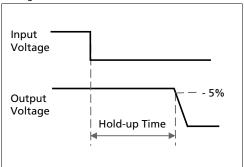

Fig. 7-2 Shut-down behavior, definitions

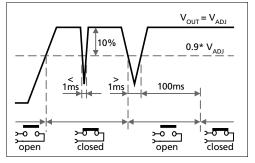

8. DC-OK RELAY CONTACT

This feature monitors the output voltage, which is produced by the DC/DC converter itself. It is independent of a backfed voltage from a unit connected in parallel to the DC/DC converter output.

Contact closes	As soon as the output voltage reaches 90% of the adjusted output voltage level.				
Contact opens	As soon as the output voltage dips more than 10% below the adjusted output voltage. Short dips will be extended to a signal length of 100ms. Dips shorter than 1ms will be ignored.				
Contact ratings	max. 60Vdc 0.3A, 30Vdc 1A, 30Vac 0.5A resistive load				
	min. 1mA at 5Vdc min. permissible load				
Isolation voltage	See dielectric strength table in chapter 18.				

Fig. 8-1 DC-OK relay contact behavior

Jan. 2025 / Rev. 1.4 DS-CPS20.241-D1-EN

C-Series

9. EFFICIENCY AND POWER LOSSES

		DC 110V	DC 300V	
Efficiency	typ.	93.1%	94.6%	at 24V, 20A
	typ.	93.0%	94.4%	at 24V, 24A (Power Boost)
Average efficiency*)	typ.	91.8%	93.4%	25% at 5A, 25% at 10A,
				25% at 15A. 25% at 20A
Power losses	typ.	7.6W	2.7W	at 24V, 0A
	typ.	18.6W	15.8W	at 24V, 10A
	typ.	35.6W	27.4W	at 24V, 20A
	typ.	42.9W	34.2W	at 24V, 24A (Power Boost)

The average efficiency is an assumption for a typical application where the DC/DC converter is loaded with 25% of the nominal load for 25% of the time, 50% of the nominal load for another 25% of the time, 75% of the nominal load for another 25% of the time and with 100% of the nominal load for the rest of the time.

Fig. 9-1 Efficiency vs. output current at 24V,

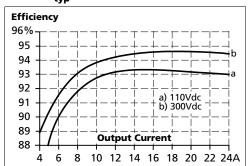

Fig. 9-3 Efficiency vs. input voltage at 24V, 20A, typ.

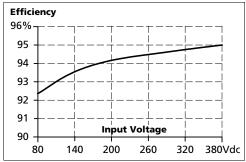

Fig. 9-2 Losses vs. output current at 24V, typ.

10. LIFETIME EXPECTANCY AND MTBF

	DC 110V	DC 300V	
Lifetime expectancy*)	169 000h*)	194 000h*)	at 24V, 10A and 40°C
	478 000h*)	549 000h*)	at 24V, 10A and 25°C
	81 000h	98 000h	at 24V, 20A and 40°C
	228 000h*)	279 000h*)	at 24V, 20A and 25°C
	48 000h	56 000h	at 24V, 24A and 40°C
	136 000h*)	158 000h*)	at 24V, 24A and 25°C
MTBF**) SN 29500, IEC 61709	468 000h	537 000h	at 24V, 20A and 40°C
	770 000h	882 000h	at 24V, 20A and 25°C
MTBF**) MIL HDBK 217F	254 000h	290 000h	at 24V, 20A and 40°C; Ground Benign GB40
	355 000h	395 000h	at 24V, 20A and 25°C; Ground Benign GB25
	56 000h	64 000h	at 24V, 20A and 40°C; Ground Fixed GF40
	75 000h	86 000h	at 24V, 20A and 25°C; Ground Fixed GF25

The Lifetime expectancy shown in the table indicates the minimum operating hours (service life) and is determined by the lifetime expectancy of the built-in electrolytic capacitors. Lifetime expectancy is specified in operational hours and is calculated according to the capacitor's manufacturer specification. The manufacturer of the electrolytic capacitors only guarantees a maximum life of up to 15 years (131 400h). Any number exceeding this value is a calculated theoretical lifetime which can be used to compare devices.

11. FUNCTIONAL DIAGRAM

Jan. 2025 / Rev. 1.4 DS-CPS20.241-D1-EN All parameters are specified at 24V, 20A, 300Vdc, +25°C ambient and after a 5 minutes run-in time unless otherwise noted.

^{**)} MTBF stands for Mean Time Between Failures, which is calculated according to statistical device failures, and indicates reliability of a device. It is the statistical representation of the likelihood of a unit to fail and does not necessarily represent the life of a product. The MTBF figure is a statistical representation of the likelihood of a device to fail. A MTBF figure of e.g. 1 000 000h means that statistically one unit will fail every 100 hours if 10 000 units are installed in the field. However, it can not be determined if the failed unit has been running for 50 000h or only for 100h.

12. TERMINALS AND WIRING

The terminals are IP20 Finger safe constructed and suitable for field- and factory wiring.

	Input and output	DC-OK-Signal
Туре	screw terminals	spring-clamp terminals
Solid wire	0.5-6mm ²	0.15-1.5mm ²
Stranded wire	0.5-4mm ²	0.15-1.5mm ²
American Wire Gauge	AWG20-10	AWG26-14
Max. wire diameter	2.8mm (including ferrules)	1.5mm (including ferrules)
Wire stripping length	7mm	7mm
Screwdriver	3.5mm slotted or cross-head No 2	3.5mm slotted (to open the spring)
Recommended tightening torque	1Nm	not applicable

Instructions:

- a) Use appropriate copper cables that are designed for minimum operating temperatures of:
 - 60°C for ambient up to 45°C and
 - 75°C for ambient up to 60°C minimum
 - 90°C for ambient up to 70°C minimum.
- b) Follow national installation codes and installation regulations!
- c) Ensure that all strands of a stranded wire enter the terminal connection!
- d) Do not use the unit without PE connection.
- e) Unused terminal compartments should be securely tightened.
- f) Ferrules are allowed.

Daisy chaining:

Daisy chaining (jumping from one DC/DC converter output to the next) is allowed as long as the average output current through one terminal pin does not exceed 25A. If the current is higher, use a separate distribution terminal block as shown in Fig. 12-2.

Fig. 12-1 Daisy chaining of outputs

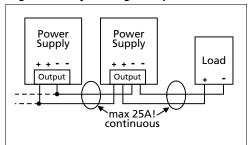

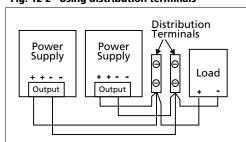

Fig. 12-2 Using distribution terminals

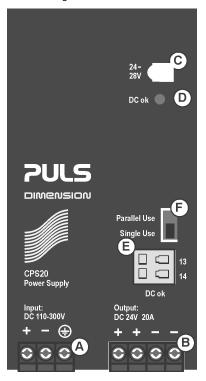

C-Series

13. FRONT SIDE AND USER ELEMENTS

Fig. 13-1 Front side

- A Input Terminals (screw terminals)
 - + Positive input
 - Negative (return) input
 - ⊕ PE (Protective Earth) input
- **B** Output Terminals (screw terminals, two pins per pole)
 - + Positive output
 - Negative (return) output

C Output voltage potentiometer

Open the flap to adjust the output voltage. Factory set: 24.1V

D DC-OK LED (green)

On, when the output voltage is >90% of the adjusted output voltage

E DC-OK Relay Contact (quick-connect spring-clamp terminals) The DC-OK relay contact is synchronized with the DC-OK LED. See chapter 8 for details.

F "Parallel Use" "Single Use" selector

Set jumper to "Parallel Use" when DC/DC converter are connected in parallel to increase the output power. In order to achieve a sharing of the load current between the individual DC/DC converter, the "parallel use" regulates the output voltage in such a manner that the voltage at no load is approx. 4% higher than at nominal load. See also chapter 22.5. A missing jumper is equal to a "Single Use" mode.

C-Series

24V, 20A, 480 W, DC/DC CONVERTER

14. EMC

The DC/DC converter is suitable for applications in industrial environment as well as in residential, commercial and light industry environment without any restrictions. A detailed EMC report is available on request.

EMC Immunity	According generic standards: EN 61000-6-1 and EN 61000-6-2				
Electrostatic discharge	EN 61000-4-2	contact discharge	8kV	Criterion A	
		air discharge	15kV	Criterion A	
Electromagnetic RF field	EN 61000-4-3	80MHz-2.7GHz	20V/m	Criterion A	
Fast transients (Burst)	EN 61000-4-4	input lines	4kV	Criterion A	
		output lines	2kV	Criterion A	
		DC-OK signal (coupling clamp)	2kV	Criterion A	
Surge voltage on input	EN 61000-4-5	+ → -	2kV	Criterion A	
		$+ \rightarrow PE, - \rightarrow PE$	4kV	Criterion A	
Surge voltage on output	EN 61000-4-5	+ → -	1kV	Criterion A	
		+ / - → PE	2kV	Criterion A	
Surge voltage on DC-OK	EN 61000-4-5	DC-OK signal → PE	1kV	Criterion A	
Conducted disturbance	EN 61000-4-6	0.15-80MHz	20V	Criterion A	

Criterions:

C: Temporary loss of function is possible. DC/DC converter may shut-down and restarts by itself. No damage or hazards for the DC/DC converter will occur.

EMC Emission	According generic standards: EN 61000-6-3 and EN 61000-6-4			
Conducted emission input lines	CISPR 16-1-2, CISPR 16-2-1	limits for DC power port according EN 61000-6-3 fulfilled		
Conducted emission output lines*)	CISPR 16-1-2, CISPR 16-2-1	limits for DC power port according EN 61000-6-3 fulfilled		
Radiated emission	EN 55011, EN 55032	Class B		

This device complies with FCC Part 15 rules.

Operation is subjected to following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

^{*)} for information only, not mandatory for EN 61000-6-3

Switching Frequencies	The DC/DC converter has two converters with two different switching frequencies included.		
Switching frequency 1	70kHz to 130kHz	PFC converter, input voltage and output power dependent	
Switching frequency 2	80kHz to 140kHz	Main converter, output power dependent

16. PROTECTION FEATURES

Output protection	Electronically protected aga	ainst overload, no-load and short-circuits*)
Output over-voltage protection	typ. 30.5Vdc max. 32Vdc	In case of an internal DC/DC converter defect, a redundant circuit limits the maximum output voltage. The output shuts down and automatically attempts to restart.
Degree of protection	IP20	EN/IEC 60529 Caution: For use in a controlled environment according to CSA 22.2 No 107.1-01.
Penetration protection	> 5mm	e.g. screws, small parts
Over-temperature protection	yes	Output shut-down with automatic restart
Input transient protection	MOV (Metal Oxide Varistor	
Internal input fuse	DC suitable fuse included	not user replaceable
Reverse input polarity protection	yes	unit does not start, no signalling

^{*)} In case of a protection event, audible noise may occur.

17. SAFETY FEATURES

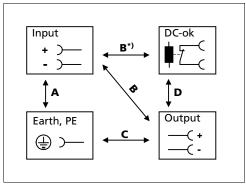

Innut / quant congretion*)	SELV	IEC/EN 60950-1	
Input / output separation*)	SELV	IEC/EIN 00330-1	
	PELV	IEC/EN 60204-1, EN 50178, IEC 62103, IEC 60364-4-41	
	double or reinford	red insulation	
Class of protection	I	PE (Protective Earth) connection required	
Isolation resistance	> 5MOhm	input to output, 500Vdc	
PE resistance	< 0.10hm		
Touch current (leakage current)	The leakage current which is produced by the DC/DC converter itself depends on the input voltage ripple and need to be investigated in the final application.		
	For a smooth DC input voltage, the produced leakage current is less than 100µA.		

^{*)} double or reinforced insulation

18. DIELECTRIC STRENGTH

The output voltage is floating and has no ohmic connection to the ground. Type and factory tests are conducted by the manufacturer. Field tests may be conducted in the field using the appropriate test equipment which applies the voltage with a slow ramp (2s up and 2s down). Connect all input-terminals together as well as all output poles before conducting the test. When testing, set the cut-off current settings to the value in the table below.

Fig. 18-1 Dielectric strength

		Α	В	C	D
Type test	60s	2500Vac	3000Vac	1000Vac	500Vac
Factory test	5s	2500Vac	2500Vac	500Vac	500Vac
Field test	5s	2000Vac	2000Vac	500Vac	500Vac
Cut-off current setting		> 15mA	> 15mA	> 20mA	> 1mA

To fulfil the PELV requirements according to EN60204-1 § 6.4.1, we recommend that either the + pole, the – pole or any other part of the output circuit shall be connected to the protective earth system. This helps to avoid situations in which a load starts unexpectedly or can not be switched off when unnoticed earth faults occur.

B*) When testing input to DC-OK ensure that the max. voltage between DC-OK and the output is not exceeded (column D). We recommend connecting DC-OK pins and the output pins together when performing the test.

21. PHYSICAL DIMENSIONS AND WEIGHT

Weight	940g
DIN rail	Use 35mm DIN rails according to EN 60715 or EN 50022 with a height of 7.5 or 15mm. The DIN rail depth must be added to the unit depth (127mm) to calculate the total required installation depth.
Installation Clearances	See chapter 2

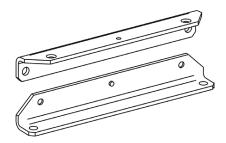

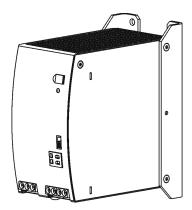

22. Accessories

22.1. ZM2.WALL - WALL MOUNTING BRACKET

This bracket is used to mount the DC/DC converter onto a flat surface without utilizing a DIN rail.

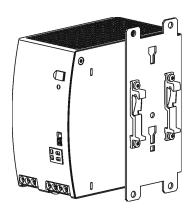

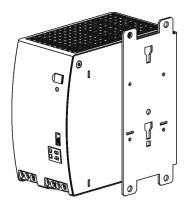

Due to the small size of the unit, it is required that the black-DIN rail slide on the back of the unit must be removed. Instructions how to do this can be found in the manual of the ZM2.WALL.

22.2. ZM13.SIDE - SIDE MOUNTING BRACKET

This bracket is used to mount DIMENSION units sideways with or without utilizing a DIN rail. The two aluminum brackets and the black plastic slider of the unit have to be detached, so that the steel brackets can be mounted. For sideway DIN rail mounting, the removed aluminum brackets and the black plastic slider need to be mounted on the steel bracket.

Side mounting with DIN rail brackets

Side mounting without DIN rail brackets

C-Series

22.3. YR40.242 - REDUNDANCY MODULES

(2x 20A Inputs, 1x 40A output)

The YR40.242 is equipped with two input channels, which are individually decoupled by utilizing mosfet technology. Using mosfets instead of diodes reduces the heat generation and the voltage drop between input and output. The YR40.242 does not require an additional auxiliary voltage and is self-powered even in case of a short circuit across the output.

Due to the low power losses, the unit is very slender and only requires 36mm width on the DIN rail.

22.4. YR40.245 - REDUNDANCY MODULES

(1x 40A input, 1x 40A output)

The YR40.245 is a 40A single channel redundancy module, which is equipped with a plug connector on the output. The plug connector allows replacing the power supply or the redundancy module while the system is running. The plug connector avoids that the output wires can touch and short the load circuit.

The YR40.245 is very slender and only requires 46mm width on the DIN rail. It also utilizes mosfet technology instead of diodes for low heat generation and a minimal voltage drop between input and output. It does not require an additional auxiliary voltage and is selfpowered even in case of a short circuit across the output.

Fig. 21-1 Typical 1+1 Redundant configuration for 20A with a dual redundancy module

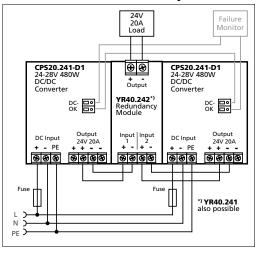

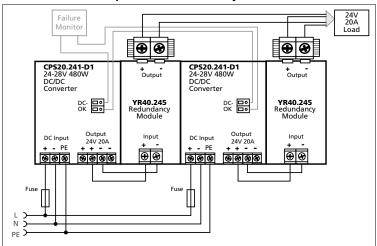

Fig. 21-2 Typical N+1 or 1+1 Redundant configuration for 20A with multiple YR40.245 redundancy modules

23. APPLICATION NOTES

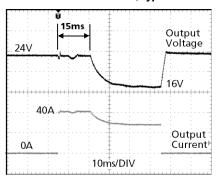

23.1. PEAK CURRENT CAPABILITY

The DC/DC converter can deliver peak currents (up to several milliseconds) which are higher than the specified short term currents. This helps to start current demanding loads. Solenoids, contactors and pneumatic modules often have a steady state coil and a pick-up coil. The inrush current demand of the pick-up coil is several times higher than the steady-state current and usually exceeds the nominal output current (including the PowerBoost). The same situation applies when starting a capacitive load.

The peak current capability also ensures the safe operation of subsequent circuit breakers of load circuits. The load branches are often individually protected with circuit breakers or fuses. In case of a short or an overload in one branch circuit, the fuse or circuit breaker need a certain amount of over-current to open in a timely manner. This avoids voltage loss in adjacent circuits.

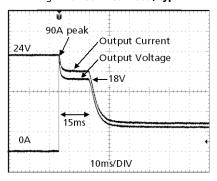

The extra current (peak current) is supplied by the power converter and the built-in large sized output capacitors of the DC/DC converter. The capacitors get discharged during such an event, which causes a voltage dip on the output. The following two examples show typical voltage dips:

Fig. 22-1 Peak load with 2x the nominal current for 50ms, typ.

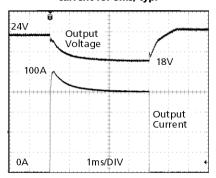

40A Peak load (resistive) for 50ms Output voltage dips from 24V to 16V.

Fig. 22-3 90A Peak load, typ.

High Overload Current (typ. 90A for 15ms) enables easy fuse tripping

Fig. 22-2 Peak load with 5x the nominal current for 5ms, typ.

100A Peak load (resistive) for 5ms Output voltage dips from 24V to 18V.

Please note: The DC-OK relay triggers when the voltage dips more than 10% for longer than 1ms.

Peak current voltage dips	tvp.	from 24V to 16V	at 40A for 50ms, resistive load
	-710-		
	tvp.	from 2/11/ to 18 51/	at 100A for 2ms, resistive load
	typ.	110111 244 (0 10.54	at 100A 101 Zilis, resistive load
	tvp.	from 24V to 18V	at 100A for 5ms, resistive load
	ιyp.	110111 247 10 167	at 100A 101 3111s, resistive load

C-Series

23.2. Inductive and Capacitive Loads

The unit is designed to supply any kind of loads, including capacitive and inductive loads. If extreme large capacitors, such as EDLCs (electric double layer capacitors or "UltraCaps") with a capacitance > 0.5F are connected to the output, the unit might charge the capacitor in the Hiccup^{PLUS}-mode (see chapter 6).

23.3. EXTERNAL INPUT PROTECTION

The unit is tested and approved for branch circuits up to 30A (UL) and 32A (IEC). An external protection is only required if the supplying branch has an ampacity greater than this. Provided, that the negative pole is grounded. If the positive pole is grounded, an additional external fast-acting input fuse in the negative input is required (E.g. 8A KLKD fuse from Littelfuse or a comparable UL-Listed fuse with the same ratings and characteristics). Otherwise the status of the UL approvals becomes void.

Check also local codes and local requirements. In some countries local regulations might apply.

If an external fuse is necessary or utilized, minimum requirements need to be considered to avoid nuisance tripping of the circuit breaker. A minimum value of 10A B- or C-Characteristic breaker should be used.

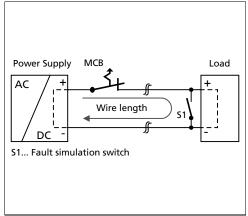

23.4. OUTPUT CIRCUIT BREAKERS

Standard miniature circuit breakers (MCB's or UL1077 circuit breakers) are commonly used for AC-supply systems and may also be used on 24V branches.

MCB's are designed to protect wires and circuits. If the ampere value and the characteristics of the MCB are adapted to the wire size that is used, the wiring is considered as thermally safe regardless of whether the MCB opens or not.

To avoid voltage dips and under-voltage situations in adjacent 24V branches which are supplied by the same source, a fast (magnetic) tripping of the MCB is desired. A quick shutdown within 10ms is necessary corresponding roughly to the ride-through time of PLC's. This requires DC/DC converters with high current reserves and large output capacitors. Furthermore, the impedance of the faulty branch must be sufficiently small in order for the current to actually flow. The best current reserve in the DC/DC converter does not help if Ohm's law does not permit current flow. The following table has typical test results showing which B- and C-Characteristic MCBs magnetically trip depending on the wire cross chapter and wire length.

Fig. 22-4 Test circuit

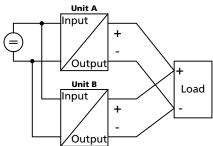

Maximal wire length*) for a fast (magnetic) tripping:

	0.75mm²	1.0mm ²	1.5mm ²	2.5mm ²
C-2A	29m	40m	56m	82m
C-3A	26m	35m	50m	77m
C-4A	21m	28m	36m	53m
C-6A	8m	10m	14m	25m
C-8A	4m	7m	11m	18m
C-10A	1m	2m	3m	6m
B-6A	17m	24m	35m	53m
B-10A	12m	16m	23m	32m
B-13A	9m	13m	20m	29m
B-16A	4m	7m	9m	17m
B-20A	1m	1m	2m	2m

Don't forget to consider twice the distance to the load (or cable length) when calculating the total wire length (+ and – wire).

23.5. Parallel Use to Increase Output Power

CPS20.241-D1 DC/DC converter can be paralleled to increase the output power. The output voltage of all DC/DC converters shall be adjusted to the same value (±100mV) in "Single use" mode with the same load conditions on all units, or the units can be left with the factory settings. After the adjustments, the jumper on the front of the unit shall be moved from "Single use" to "Parallel use", in order to achieve load sharing. The "Parallel use" mode regulates the output voltage in such a manner that the voltage at no load is approx. 4% higher than at nominal load. See also chapter 6. If no jumper is plugged in, the unit is in "Single use" mode. Factory setting is "Single use" mode.

If more than three units are connected in parallel, a fuse or circuit breaker with a rating of 30A or 32A is required on each output. Alternatively, a diode or redundancy module can also be utilized

Energize all units at the same time to avoid the overload Hiccup^{PLUS} mode. It also might be necessary to cycle the input power (turn-off for at least five seconds), if the output was in Hiccup^{PLUS} mode due to overload or short circuits and the required output current is higher than the current of one unit.

Keep an installation clearance of 15mm (left / right) between two DC/DC converters and avoid installing the DC/DC converters on top of each other. Do not use DC/DC converters in parallel in mounting orientations other than the standard mounting orientation (terminals on bottom of the unit) or in any other condition where a derating of the output current is required (e.g. altitude, above 60°C, ...).

Pay attention that EMI and inrush current will increase when using multiple DC/DC converters.

23.6. PARALLEL USE FOR REDUNDANCY

DC/DC converters can be paralleled for redundancy to gain higher system availability. Redundant systems require a certain amount of extra power to support the load in case one DC/DC converter unit fails. The simplest way is to put two DC/DC converters in parallel. This is called a 1+1 redundancy. In case one DC/DC converter unit fails, the other one is automatically able to support the load current without any interruption. Redundant systems for a higher power demand are usually built in a N+1 method. E.g. five DC/DC converter, each rated for 20A are paralleled to build a 80A redundant system. For N+1 redundancy the same restrictions apply as for increasing the output power, see also chapter 22.5.

Please note: This simple way to build a redundant system does not cover failures such as an internal short circuit in the secondary side of the DC/DC converter. In such a case, the defective unit becomes a load for the other DC/DC converters and the output voltage can not be maintained any more. This can be avoided by utilizing redundancy modules, which have decoupling devices (diodes or mosfets) included. Further information and wiring configurations can be found in chapter 21.3.

Recommendations for building redundant power systems:

- a) Use separate input fuses for each DC/DC converter.
- b) Set the DC/DC converter into "Parallel use" mode.
- Monitor the individual DC/DC converter units. Therefore, use the DC-OK relay contact of the CPS20 DC/DC converter.
- d) It is desirable to set the output voltages of all units to the same value (± 100mV) or leave it at the factory setting.

Jan. 2025 / Rev. 1.4 DS-CPS20.241-D1-EN

C-Series

24V, 20A, 480 W, DC/DC CONVERTER

23.7. SERIES OPERATION

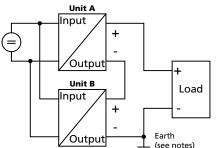

DC/DC converters of the same type can be connected in series for higher output voltages. It is possible to connect as many units in series as needed, providing the sum of the output voltage does not exceed 150Vdc. Voltages with a potential above 60Vdc are not SELV any more and can be dangerous. Such voltages must be installed with a protection against touching.

Earthing of the output is required when the sum of the output voltage is above 60Vdc.

Avoid return voltage (e.g. from a decelerating motor or battery) which is applied to the output terminals.

Keep an installation clearance of 15mm (left / right) between two DC/DC converters and avoid installing the DC/DC converters on top of each other. Do not use DC/DC converters in series in mounting orientations other than the standard mounting orientation (terminals on bottom of the unit).

Pay attention that EMI and inrush current will increase when using multiple DC/DC converters.

23.8. BACK-FEEDING LOADS

Loads such as decelerating motors and inductors can feed voltage back to the DC/DC converter. This feature is also called return voltage immunity or resistance against Back- E.M.F. (<u>Electro Magnetic Force</u>).

This DC/DC converter is resistant and does not show malfunctioning when a load feeds back voltage to the DC/DC converter. It does not matter whether the DC/DC converter is on or off.

The maximum allowed feed-back-voltage is 35Vdc. The absorbing energy can be calculated according to the built-in large sized output capacitor which is specified in chapter 6.

C-Series

24V, 20A, 480 W, DC/DC CONVERTER

23.9. CHARGING OF BATTERIES

The DC/DC converter can be used to charge lead-acid or maintenance free batteries. (Two 12V batteries in series) **Instructions for charging batteries:**

a) Set output voltage (measured at no load and at the battery end of the cable) very precisely to the end-of-charge voltage.

End-of-charge voltage	27.8V	27.5V	27.15V	26.8V
Battery temperature	10°C	20°C	30°C	40°C

- b) Use a 30A or 32A circuit breaker (or blocking diode) between the DC/DC converter and the battery.
- c) Ensure that the output current of the DC/DC converter is below the allowed charging current of the battery.
- d) Use only matched batteries when putting 12V types in series.
- e) The return current to the DC/DC converter (battery discharge current) is typ. 23mA when the DC/DC converter is switched off (except in case a blocking diode is utilized).

23.10. Use in a Tightly Sealed Enclosure

When the DC/DC converter is installed in a tightly sealed enclosure, the temperature inside the enclosure will be higher than outside. In such situations, the inside temperature defines the ambient temperature for the DC/DC converter.

The following measurement results can be used as a reference to estimate the temperature rise inside the enclosure.

The DC/DC converter is placed in the middle of the box, no other heat producing items are inside the box

Enclosure: Rittal Typ IP66 Box PK 9522 100, plastic, 254x180x165mm

Load: 24V, 16A; (=80%) load is placed outside the box

Input: 300Vdc

Temperature inside enclosure: 51.5°C (in the middle of the right side of the DC/DC converter with a distance of 2cm)

Temperature outside enclosure: 25.0°C Temperature rise: 25.5K

C-Series

23.11. MOUNTING ORIENTATIONS

Mounting orientations other than all terminals on the bottom require a reduction in continuous output power or a limitation in the maximum allowed ambient temperature. The amount of reduction influences the lifetime expectancy of the DC/DC converter. Therefore, two different derating curves for continuous operation can be found below:

Curve A1 Recommended output current.

Curve A2 Max allowed output current (results in approximately half the lifetime expectancy of A1).
